Building a New Electric World

Altistart 48 :

A new range for even better *performance...*

At *the heart of your applications,*

The new Altistart 48 soft start - soft stop unit gives you :

- High performance with its exclusive concept* for perfectly controlled starting and deceleration,
- Protection at all levels
- Easy integration in enclosures and control systems.

Two voltage ranges :

- 230 to 415V,
- 208 to 690V.

for 50 and 60 Hz line supplies

- Wide tolerance range for generators

for motor ratings from 4 to 1,200 kW

Standards and approvals

UL / CSA / IEC 60947-4-2
EMC: classes A and B
DNV (marine, off-shore)
C-TICK / GHOST / CCIB / NOM.

CE marking

in accordance with standard IEC 60947-4-2

* "TCS" patented system :
Torque Control System

... and so *simple*

Take the strain
off your motors,
your machines...
and your
operating
budgets...

The new generation of Altistart 48 starters has been designed to continually improve the operation of your machines :

- By reducing mechanical or hydraulic stress
- By reducing stress on the electrical distribution system (voltage peaks, overcurrent).
- By limiting energy loss and temperature rise, etc....

Wire it, connect... and start

Factory set, the Altistart 48 is operational immediately.

Customize your settings

Adjust the parameters of your motor using a simple, intuitive menu.

Let the Power Suite* software guide you

To prepare, store, print out configurations, compare files, etc....

Pocket PC

It is so simple to transfer data from the PC to the Pocket PC and vice versa.

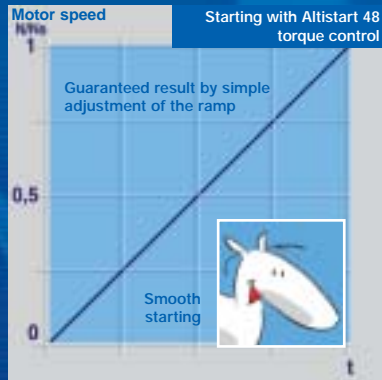

* Software which is common to the Altivar range of variable speed drives.
Operating system available in 5 languages (English, French, German, Spanish and Italian).

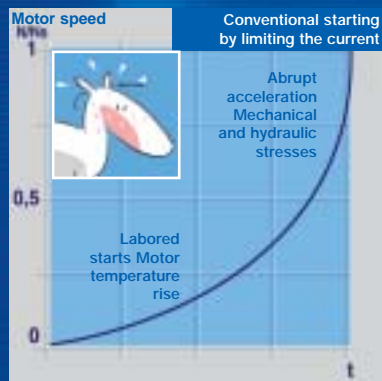

High performance with the *exclusive TCS* concept*

***TCS patent :**
Torque Control System.

With **motor torque control**,
Altistart 48 provides perfect control of
the starting and stopping of machines.

Control of the motor torque for the whole acceleration and deceleration period

Motor torque not controlled :
non-linear acceleration
and deceleration

To limit stress on the drive chain.

Only with the Altistart 48 "TCS" system is it possible to :

- Maintain gradual acceleration up to nominal speed, even if there is a high starting torque
- Improve the lifetime of the belts and the mechanism

To reduce hydraulic transients.

Only with the Altistart 48 "TCS" system is it possible to:

- Very effectively reduce pressure surges and valve surges whatever the load conditions of the pump, while maintaining smooth deceleration, from full speed to stop.

With **conventional starting** by limiting the current :

- Labored starting causing motor temperature rise
- Abrupt ending of acceleration causing mechanical stress
- Difficult adjustment compromise

With **conventional starting** by limiting the current :

- Abrupt acceleration at the end of the ramp, causing sudden pressurization of the hydraulic lines.
- Uncontrolled deceleration which may lead to pressure surges...

Protection at all levels

motor :

- Thermal protection :
 - by calculation of the I^2t in accordance with IEC 60947-4-2.
 - by using PTC probes.
- Preheating function preventing condensation.
- Detection of phase failure.

machine :

- Underload and overload protection with adjustable thresholds and times
- Locked rotor
- Control of the direction of rotation

Strength
on lines subject to interference

Easy integration...

... in enclosures...

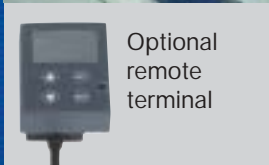

- **Simplified wiring** with through connection on all models
- Control of the starter bypass contactor at the end of starting with all protective functions maintained (thermal, underload, overload, etc...)

Control of the line contactor by the l'Altistart 48

Bypass contactor to prevent heat dissipation in the enclosure

Optional remote terminal

... and in control systems

Functions to assist with the operation of your installations :

- Configuration of a second motor with different characteristics
- Display of electrical values (current, power, etc), load conditions and operating time.
- Maintenance of operator dialog due to a separate control circuit supply.
- A large number of configurable I/O (4 logic inputs, 2 logic outputs, 3 relay outputs and 1 analog output)
- Cascaded starting and deceleration of a number of motors

A wide range of communication functions for remote access to control, monitoring and adjustment functions :

- **Integrated Modbus.**
- Communication modules :
 - Fipio, Profibus DP, DeviceNet.
 - Ethernet TCP/IP for setting up Transparent Factory : open control systems platform based on Internet technology

Removable control circuit terminal blocks

Transparent
FACTORY
Open for Business

Altistart 48 at the heart of your *applications*

With the *torque control*
and *functions* of the Altistart 48

Pumps

Standard*

- Better control of hydraulic transients :
 - Gradual pressurization of fluid in lines
 - Reduction of pressure surges and valve surges (in presence of line supply)
 - Elimination of damage to filters or spouts (irrigation) and premature wear of lines, etc
 - Less stress on pipes with the reduction of pressure-over pressure phenomena
- Independent adjustment of the load conditions.
- Protection against underload (running dry), loss or inversion of phases and in the event of a locked rotor.
- Automatic switching of the motor to freewheel mode on stopping, when the flow rate of the pump drops to a low level, to prevent overheating.

Fans and high inertia machines

(centrifuge, grinder, crusher, etc...)

- Smooth starting, preventing stress on the drive chain and slipping of belts.
- "Smoke extraction" function
- Limitation of current and voltage drops on starting.
- Catching on the fly of a fan rotating in reverse.
- Detection of overload caused by clogging or underload (broken fan motor transmission)
- Braking torque on stopping.

Standard* or severe* (>30s)

Compressors

Standard* or severe* (>30s)

- Elimination of slipping of belts.
- Reduction of current peaks.
- Protection even for special motors.
- Detection of inversion of direction of rotation of phases.
- Contact for automatic emptying on stopping.

Conveyors

Standard*

- Gradual starting, reducing shocks and slipping of belts.
- Overload control to detect faults, hard spots or jamming, or underload control to detect breaks

* "Standard" or "severe" defines the type of application, so that the starter can be chosen from the selection guide.

Altistart 48 *selection guide*

* Starting time greater than 30 seconds (see previous page defining the types of application)

Soft starters

Altistart 48 soft start - soft stop units

Applications

The Altistart 48 soft start - soft stop unit is a controller with 6 thyristors which is used for the torque-controlled soft starting and stopping of three-phase squirrel cage asynchronous motors in the power range between 4 and 1200 kW.

It offers soft starting and deceleration functions along with machine and motor protection functions as well as functions for communicating with control systems. These functions are designed for use in state-of-the-art applications in centrifugal machines, pumps, fans, compressors and conveyors, which are primarily to be found in the construction, food and beverages and chemical industries. The high-performance algorithms of the Altistart 48 contribute significantly to its robustness, safety and ease of setup.

The Altistart 48 soft start - soft stop unit is a cost-effective solution which can:

- Reduce machine operating costs by reducing mechanical stress and improving machine availability
- Reduce the stress placed on the electrical distribution system by reducing line current peaks and voltage drops during motor starts

The Altistart soft start - soft stop unit offer comprises 2 ranges:

- Three-phase voltages 230 to 415 V, 50/60 Hz
- Three-phase voltages 208 to 690 V, 50/60 Hz

In each voltage range, the Altistart soft start - soft stop units are dimensioned for standard and severe applications.

Functions

The Altistart 48 soft start - soft stop unit (1) is supplied ready for use in a standard application with motor protection class 10 (see page 60526/5).

It comprises a built-in terminal (2) which can be used to modify programming, adjustment or monitoring functions in order to adapt and customise the application to meet individual customer requirements.

■ Drive performance functions:

- Exclusive Altistart torque control (patented by Schneider Electric)
- Constant control of the torque supplied to the motor during acceleration and deceleration periods (significantly reducing pressure surges)
- Facility for adjusting the ramp and the starting torque
- The starter can be bypassed using a contactor (3) at the end of the starting period whilst maintaining electronic protection (bypass function)
- Wide frequency tolerance for generator set power supplies
- The starter can be connected to the motor delta terminals in series with each winding

■ Machine and motor protection functions:

- Built-in motor thermal protection
- Processing of information from PTC thermal probes
- Monitoring of the starting time
- Motor preheating function
- Protection against underloads and overcurrents during continuous operation

■ Functions facilitating the integration of the unit into control systems:

- 4 logic inputs, 2 logic outputs, 3 relay outputs and 1 analogue output
- Plug-in I/O connectors
- Function for configuring a second motor and easy-to-adapt settings
- Display of electrical values, the state of the load and the operating time
- RS 485 serial link for connection to Modbus

Options

A remote terminal (4) can be mounted on the door of a wall-fixing or floor-standing enclosure.

PowerSuite advanced dialogue solutions:

- PowerSuite Pocket PC with PPC type terminal (5),
- PowerSuite software workshop (6).

A range of wiring accessories for connecting the starter to PLCs via a Modbus connection (7).

Bus communication and Ethernet, Fipio, DeviceNet and Profibus DP network communication options

Soft starters

Altistart 48 soft start - soft stop units

Environment				
Conformity to standards			The electronic starters have been developed and performance tested in accordance with international standards, in particular with the starter product standard EN/IEC 60947-4-2.	
CE marking			Products have CE marking in accordance with the harmonised standard EN/IEC 60947-4-2.	
Product approvals			UL, CSA Pending: DNV, C-Tick, Ghost, CCIB	
Degree of protection	Starters ATS 48D17● to 48C11● Starters ATS 48C14● to 48M12● (1)		IP 20 (IP 00 in the absence of connections) IP 00	
Vibration resistance	Conforming to IEC 60068-2-6		1.5 mm from 2 to 13 Hz 1gn from 13 to 200 Hz	
Shock resistance	Conforming to IEC 60068-2-27		15 g for 11 ms	
Starter noise level (2)	Starters ATS 48D32● to D47●	dBA	52	
	Starters ATS 48D62● to C11●	dBA	58	
	Starters ATS 48C14● to C17●	dBA	50	
	Starters ATS 48C21● to C32●	dBA	54	
	Starters ATS 48C41● to C66●	dBA	55	
	Starters ATS 48C79● to M12●	dBA	60	
Fans	Starters ATS 48D17● and D22● Starters ATS 48D32● to M12●		Natural convection Forced convection. The fans are activated automatically when a temperature threshold is reached. For flow rate see page 60523/5.	
	Ambient temperature around the unit	Operation	°C	- 10...+ 40 without derating (between + 40 and + 60, derate the nominal current of the Altistart by 2% for each °C).
	Storage, conforming to IEC 60947-4-2		°C	- 25...+ 70
Maximum relative humidity	Conforming to IEC 60068-2-3			95% without condensation or dripping water
Maximum ambient pollution	Conforming to IEC 60664-1			Level 3
Maximum operating altitude			m	1000 without derating (above this, derate the nominal current of the Altistart by 2.2% for each additional 100 m). Limit to 2000 m.
Operating position	Maximum permanent angle in relation to the normal vertical mounting position			

Electrical characteristics			
Operating category	Conforming to IEC 60947-4-2		AC-53a
Three-phase supply voltage	Starters ATS 48●●●Q	V	230 -15% to 415 + 10%
	Starters ATS 48●●●Y	V	208 - 15% to 690 + 10%
Frequency		Hz	50/60 ± 5% (automatic) 50 or 60 ± 20% (must be set)
Nominal starter current	Starters ATS 48●●●Q	A	17...1200
	Starters ATS 48●●●Y	A	17 to 1200
Motor power	Starters ATS 48●●●Q	kW	4 to 630
	Starters ATS 48●●●Y	kW/HP	5.5 to 900/5 to 1200
Voltage indicated on the motor rating plate	Starters ATS 48●●●Q	V	230 to 415
	Starters ATS 48●●●Y	V	208 to 690
Starter control circuit supply voltage	Starters ATS 48●●●Q	V	220 - 15% to 415 + 10%, 50/60 Hz
	Starters ATS 48●●●Y	V	110 - 15% to 230 + 10%, 50/60 Hz
Maximum control circuit consumption (with fans operating)	Starters ATS 48D17● to C17●	W	30
	Starters ATS 48C21● to C32●	W	50
	Starters ATS 48C41● to M12●	W	80
Relay output (2 configurable outputs)	3 relay outputs (R1, R2, R3), normally open contacts 1"N/O" Minimum switching capacity: 10 mA for ~ 6 V. Maximum switching capacity on inductive load: 1.8 A for ~ 230 V and ~ 30 V (cos φ= 0.5 and L/R=20ms). Maximum nominal operating voltage ~ 400 V. Factory setting: R1 assigned as the "fault relay" (configurable) R2 assigned as the "end of starting relay" to control the starter bypass relay R3 assigned as "motor powered" (configurable)		

(1) Protective covers can be fitted to the power terminals of ATS 48C14● to C32● starters. ATS 48C41● to 48M12● starters have protection on the front panel and on the sides.

(2) Starters located 1 m away. The noise levels may change depending on the characteristics of the fans.

Electrical characteristics (continued)

Logic inputs LI (2 configurable inputs)		4 logic inputs, impedance 4.3 kΩ, isolated: Stop, Run, LI3, LI4. + 24 V power supply (maximum 30 V) I max. 8 mA State 0 if U < 5 V and I < 2 mA State 1 if U > 11 V and I > 5 mA
Internal source available		1 x + 24 V output, isolated and protected against short-circuits and overloads. Accuracy ± 25%. Max. current 200 mA.
Logic outputs LO (configurable)		2 logic outputs LO1 and LO2 with 0 V common, compatible with level 1 PLC, according to standard IEC 65A-68. + 24 V power supply (minimum: +12 V, maximum: +30 V). Maximum output current: 200 mA if supplied externally
Analogue output AO (configurable)		Current output 0-20 mA or 4-20 mA Maximum load impedance: 500 Ω Accuracy ± 5% of the maximum value
Input for PTC probe		Total resistance of probe circuit 750 Ω at 25°C, according to IEC 60 738-A
Maximum I/O connection capacity		2.5 mm ² (AWG 12)
Communication		RS 485 multidrop serial link integrated in the starter, for Modbus, with RJ45 type connector Transmission speed 4800, 9600 or 19200 bps Maximum number of Altistart 48 connected: 18 Other uses: - connection to a remote terminal or - connection to a PC or - connection to other buses and networks via communication options.
Protection	Thermal	Built-in, starter and motor (calculated and/or thermal protection with PTC probes)
	Line protection	Phase failure, indicated by output relay
Current settings		The nominal motor current I _n can be adjusted from 0.4 to 1.3 times the starter nominal current. Adjustment of the maximum starting current from 1.5 to 7 times the motor I _n , limited to 5 times the starter nominal current.
Starting mode		By torque control with starter current limited to 5 I _n maximum. Factory setting: 4 I _n for standard operation on 15 s torque ramp
Stopping mode	Freewheel stop	"Freewheel" stop (factory setting)
	Controlled stop on torque ramp	Programmed between 0.5 and 60 s (for pump applications)
	Braked stop	Controlled dynamically by the flux

Electromagnetic compatibility EMC (1)

	Standards	Test levels	Examples (sources of interference)
Summary of immunity tests carried out with the Altistart 48	IEC 61000-4-2 level 3 Electrostatic discharge: - by contact - in the air	6 kV 8 kV	Contact off an electrically charged individual
	IEC 61000-4-3 level 3 Radiated electromagnetic fields	10 V/m	Equipment transmitting radio frequencies
	IEC 61000-4-4 level 4 Rapid electrical transients: - power supply cables - control cables	4 kV 2 kV	Opening/closing of a contactor
	IEC 61000-4-5 level 3 Shock wave: - phase/phase - phase/earth	1 kV 2 kV	-
	IEC 61000-4-12 level 3 Damped oscillating waves	1 kV - 1 MHz	Oscillating circuit on the line supply
Radiated and conducted emissions	According to IEC 60947-4-2, class A, on all starters According to IEC 60947-4-2, class B, on starters up to 170 A: ATS 48D17● to 48C17●. Must be bypassed at the end of starting		

(1) The starters conform to product standard IEC 60947-4-2, in particular with regard to EMC. This standard ensures a level of immunity for products and a level of emitted interference. In steady state, the interference emitted is below that required by the standard. During acceleration and deceleration phases, low level loads may be affected by low frequency interference (harmonics). To reduce this interference, connect chokes between the line supply and the Altistart 48 (see page 60528/3).

Note:

- Power factor correction capacitors can only be used upstream of the Altistart and only powered up at the end of starting.
- The starter must be earthed to conform to the regulations concerning leakage currents (≤ 30 mA). When the use of an upstream "residual current device" for protection is required by the installation standards, an A-Si type device must be used. Check its compatibility with the other protective devices. If the installation involves several starters on the same line supply, each starter must be earthed separately.

Torque characteristics

Curves indicating changes in the torque depending on the starting current of a three-phase asynchronous motor.

Curves 1: direct line starting

Curves 2: starting in current limiting mode

Torque curve T_{s1} indicates the total torque range available depending on the limiting current I_{s1} .

Limiting the starting current I_s to a preset value I_{s1} will reduce the starting torque T_{s1} to a value which is almost equal to the square of currents I_{s1}/I_s .

Example:

For motor characteristics: $T_s = 3 T_n$ for $I_s = 6 I_n$,

limit the current to $I_{s1} = 3 I_n$ (0.5 I_s)

resulting in a starting torque $T_{s1} = T_s \times (0.5)^2 = 3 T_n \times 0.25 = 0.75 T_n$

Starting current

- 1 Direct line starting current
- 2 Starting current limited to I_{s1}

Starting torque

- 1 Direct line starting torque
- 2 Starting torque with current limited to I_{s1}

Conventional starting using current limitation or voltage ramp

With current limitation I_{s1} , the accelerating torque applied to the motor is equal to the motor torque T_{s1} minus the resistive torque T_r . The accelerating torque increases in the starting range as the speed changes and is at its highest at the end of acceleration (curve 2). This characteristic means that the load is taken up very abruptly, which is not recommended for pump type applications.

Example of speed curve for starting with current limitation

- 1 Current applied to the motor (I/I_n)
- 2 Motor speed N/N_s

Starting with the Altistart 48

Torque control on the Altistart 48 applies the torque to the motor during the entire starting phase if the current required (curve 1) does not exceed the limiting current. The accelerating torque can be virtually constant over the entire speed range (curve 2). It is possible to set the Altistart in order to obtain a high torque on starting for a rapid motor speed rise whilst limiting its temperature rise, and a lower accelerating torque at the end of starting for gradual loading. This control function is ideal for centrifugal pumps or for machines with high resistive torque on starting.

Example of speed curve for starting with torque control

- 1 Current applied to the motor (I/I_n)
- 2 Motor speed N/N_s

Stopping with the Altistart 48

- Freewheel stop: the motor comes to a freewheel stop.
- Decelerated stop: this type of stop is ideal for pumps and can be used to effectively reduce pressure surges. Torque control on the Altistart 48 reduces the effect of hydraulic transients even if the load increases. This type of control makes adjustment easy.
- Braked stop: this type of stop is suitable for high inertia applications as it reduces the stopping time of the machine.

Soft starters

(1) Value indicated on the motor rating plate

(2) Corresponds to the maximum permanent current in class 10. I_{cL} corresponds to the starter rating.

(3) Corresponds to the maximum permanent current in class 20.

(4) The factory setting current corresponds to the value of the nominal current of a standard motor according to NEC, 460 V, class 10 (standard application). Adjust the settings in accordance with the motor nominal current.

Soft starters

Altistart 48 soft start - soft stop units

ATS 48D17● to ATS 48D47●

Maximum connection capacity:
 Earth connections: 10 mm² (AWG 8)
 Power terminals: 16 mm² (AWG 8)

ATS 48D62● to ATS 48C11●

Maximum connection capacity:
 Earth connections: 16 mm² (AWG 4)
 Power terminals: 50 mm² (AWG 2/0)

ATS 48C14● to ATS 48C17●

Maximum connection capacity:
 Earth connections: 120 mm² (busbar)
 Power terminals: 95 mm² (AWG 2/0)

ATS 48C21● to ATS 48C32●

Maximum connection capacity:
 Earth connections: 120 mm² (busbar)
 Power terminals: 240 mm² (busbar)

ATS 48C41 to C66

Maximum connection capacity:

Earth connections:

240 mm² (busbar)

Power terminals:

2 x 240 mm² (busbar)

ATS 48C79 to M12

Maximum connection capacity:

Earth connections:

2 x 240 mm² (busbar)

Power terminals:

4 x 240 mm² (busbar)

Mounting the remote terminal

VW3 G48101

Mounting recommendations

- Install the Altistart vertically, at $\pm 10^\circ$.
- Do not place the Altistart close to or above heating elements.
- Leave sufficient free space to ensure that the air required for cooling purposes can circulate from the bottom to the top of the unit.

Caution: The IP 00 version of the Altistart 48 must be fitted with a protective bar to protect personnel against electrical contact. Protective covers are available for the ATS 48C14● to ATS 48C32●. They should be ordered separately.

Mounting in a metal wall-fixing or floor-standing enclosure with degree of protection IP 23 or IP 54

- Observe the mounting recommendations above.
- To ensure proper air circulation in the starter:
 - Fit ventilation grilles
 - Ensure that there is sufficient ventilation. If there is not, install forced ventilation with a filter. The openings and/or fans must provide a flow rate at least equal to that of the starter fans (see the table below)
 - Use special filters with IP 54 protection.

Fan flow rate depending on the starter rating

ATS 48 starter	Flow rate m ³ /hour
ATS48 D32● and D38●	14
ATS48 D47●	28
ATS48 D62● to C11●	86
ATS48 C14● and C17●	138
ATS48 C21● to C32●	280
ATS48 C41● to C66●	600
ATS48 C29● to M12●	1200

Metal wall-fixing or floor-standing enclosure with IP 54 degree of protection
 For non-ventilated Altistart units (ATS 48D17● and 48D22●), install a fan ≤ 50 mm below the starter to circulate the air inside the enclosure in order to avoid hot spots.

Calculating the size of the enclosure

Maximum thermal resistance R_{th} (°C/W)

$$R_{th} = \frac{\theta - \theta_e}{P}$$

θ = maximum temperature inside enclosure in °C
 θ_e = maximum external temperature in °C
 P = total power dissipated in the enclosure in W

The starter/motor combinations on pages 60522/2 and 60522/3 can only be used in ambient temperatures $\leq 40^\circ\text{C}$.
 For temperatures between 40°C and 60°C , derate the maximum permanent current of the starter by 2% for every degree above 40°C .
 Power dissipated by the starter: see pages 60522/2 and 60522/3.
 If the starts are infrequent, it is advisable to bypass the Altistart at the end of starting in order to reduce heat dissipation.
 The power dissipated will then be between 15 and 30 W.
 Add the power dissipated by the other equipment components.

Effective exchange surface area of enclosure S (m²)

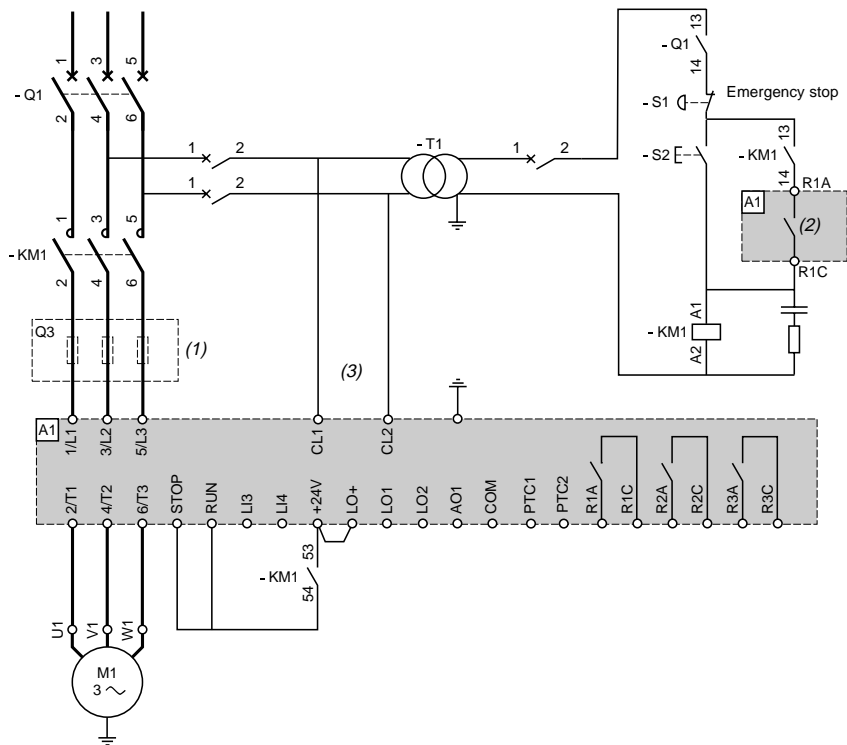

(sides + top + front panel if wall-mounted)

$$S = \frac{K}{R_{th}}$$

K is the thermal resistance per m² of casing

For ACM type metal enclosures: K = 0.12 with internal fan, K = 0.15 without fan
Caution: Do not use insulated enclosures as they have a poor level of conductivity.

Recommended application diagram for non-reversing unit with line contactor, type 1 and type 2 coordination

Select the components to connect, according to the descriptions on page 60524/3, from the association tables on pages 60525/2 to 60525/11.

- (1) For type 2 coordination (according to IEC 60947-4-2), install fast-acting fuses to ensure that the starter will be protected in the event of a short-circuit.
- (2) Assign relay R1 as the "isolating relay". Beware of the operating limits of the contacts (see Characteristics page 60521/2), for example when connecting to high rating contactors.
- (3) Insert a transformer if the line voltage is different to that defined for the control circuit (see page 60521/2).

Types of coordination

The standard defines tests for different current levels which are designed to expose the device to extreme conditions. Based on the state of the components after a short-circuit test, the standard defines 2 types of coordination.

- Type 1 coordination: Damage to the contactor and the starter is acceptable under 2 conditions:

- No risk is posed to the operator
 - Elements other than the contactor and the starter are not damaged
- Maintenance must be carried out after a short-circuit.

- Type 2 coordination: Minor soldering of the contactor contacts is permissible if they can be separated easily. The starter must not be damaged beyond repair. The protection and control devices remain operational after type 2 coordination tests. Once the fuses have been replaced, check the contactor.

Note: The starter will protect the motor and the cables against overloads. If this protection function is disabled, external thermal protection must be provided.

Recommended application diagram for non-reversing unit with starter line and bypass contactors, type 1 and type 2 coordination

Select the components to connect, according to the descriptions below, from the association tables on pages 60525/2 to 60525/11.

- (1) For type 2 coordination (according to IEC 60947-4-2), install fast-acting fuses to ensure that the starter will be protected in the event of a short-circuit.
- (2) Assign relay R1 as the "isolating relay". Beware of the operating limits of the contacts (see Characteristics page 60521/2), for example when connecting to high rating contactors.
- (3) Insert a transformer if the line voltage is different to that defined for the control circuit (see page 60521/2).
- (4) 2-wire and 3-wire control (see page 60526/8).

Components to connect depending on the types of coordination and voltages

Designation	Description
M1	Motor
A1	Starter (standard applications and severe applications)
Q1	Circuit-breaker or switch/fuses
Q3	3 FA fuses
KM1, KM3	Contactors
S1, S2	Control (separate parts XB2 or XB2 M)

Recommended application diagram for connection to the motor delta terminals, non-reversing, freewheel stop, with starter line and bypass contactors, type 1 and type 2 coordination

This type of wiring enables the starter rating to be reduced.
ATS 48●●●Q

Select the components to connect according to the descriptions on page 60524/5 and the association tables on pages 60525/2 to 60525/11.

- (1) A line contactor must be used in the sequence.
- (2) For type 2 coordination (according to IEC 60947-4-2), install fast-acting fuses to ensure that the starter will be protected in the event of a short-circuit.
- (3) R1 must be assigned as the "isolating relay" to control contactor KM1. Beware of the operating limits of the contacts. (see Characteristics page 60521-2), for example when connecting to high rating contactors.
- (4) Insert a transformer if the line voltage is different to that defined for the control circuit (see page 60521/2)
- (5) 2-wire and 3-wire control (see page 60526/8).

Types of coordination

The standard defines tests for different current levels which are designed to expose the device to extreme conditions. Based on the state of the components after a short-circuit test, the standard defines 2 types of coordination.

- Type 1 coordination: damage to the contactor and the starter is acceptable under 2 conditions:

- No risk is posed to the operator
 - Elements other than the contactor and the starter are not damaged
- Maintenance must be carried out after a short-circuit.

- Type 2 coordination: Minor soldering of the contactor contacts is permissible if they can be separated easily. The starter must not be damaged beyond repair. The protection and control devices remain operational after type 2 coordination tests. Once the fuses have been replaced, check the contactor.

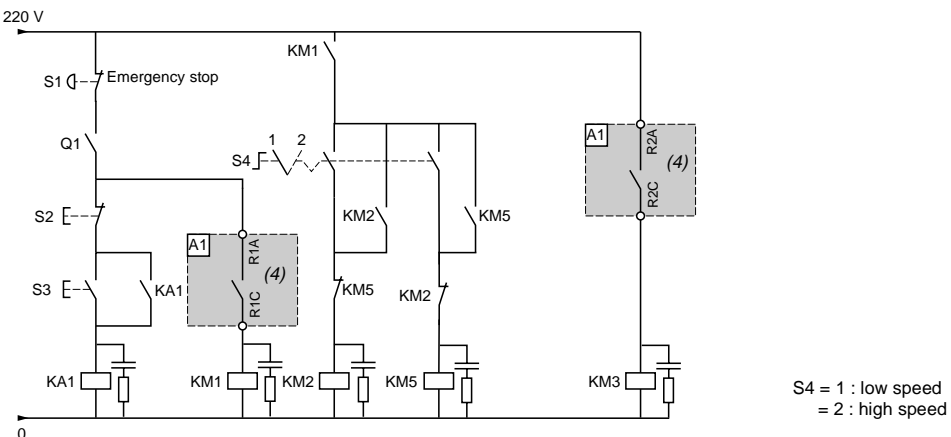

Note: The starter will protect the motor and the cables against overloads. If this protection function is disabled, external thermal protection must be provided.

Recommended application diagram for LSP/HSP motor, non-reversing with starter line and bypass contactors

Select the components to connect, according to the descriptions below, from the association tables on pages 60525/2 to 60525/11.

- (1) For type 2 coordination (according to IEC 60947-4-2), install fast-acting fuses to ensure that the starter will be protected in the event of a short-circuit.
- (2) Insert a transformer if the line voltage is different to that defined for the control circuit (see page 60521/2).
- (3) Assign logic input LI3 to "activate the adjustment functions of the 2nd motor".
- (4) Assign relay R1 as the "isolating relay". Beware of the operating limits of the contacts (see Characteristics page 60521/2), for example when connecting to high rating contactors.

Components to connect depending on the types of coordination and voltages

Designation	Description
M1	Motor
A1	Starter (standard applications and severe applications)
Q1	Circuit-breaker or switch/fuses
Q3	3 FA fuses
KM1, KM2, KM3, KM5, KA1	Contactors and relays
S1, S2, S3	Control (separate parts XB2 or XB2 M)

Recommended application diagram for starting and decelerating several motors cascaded with a single Altistart 48, non-reversing and line contactor

The diagram is given as an example only. For more details, refer to the Altistart 48 user's manual.

Select the components to connect, according to the designations below, from the association tables on pages 60525/2 to 60525/11.

(1) For type 2 coordination (according to IEC 60947-4-2), install fast-acting fuses to ensure that the starter will be protected in the event of a short-circuit.

(2) Insert a transformer if the line voltage is different to that defined for the control circuit (see page 60521/2).

Important:

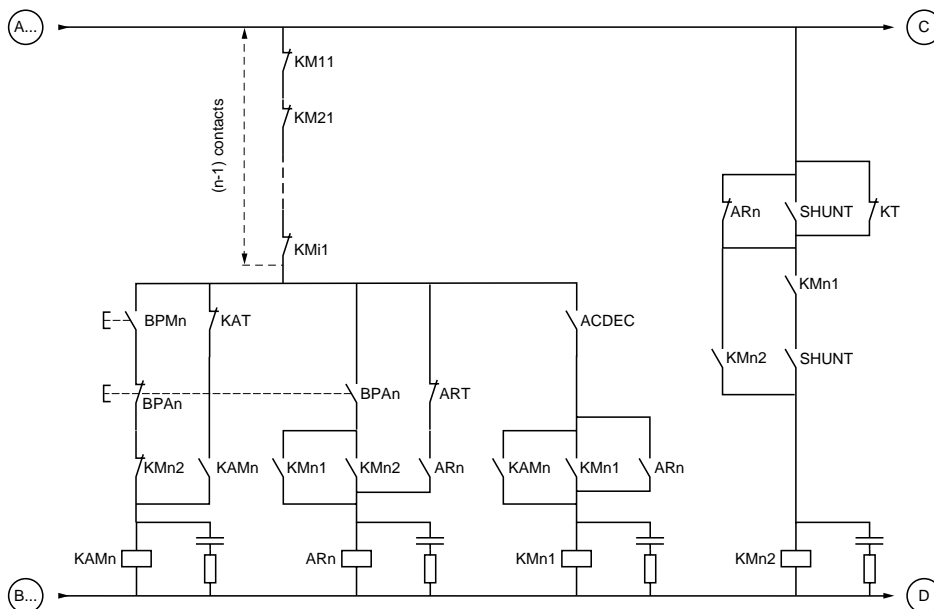

- One Altistart 48 logic input must be configured as a "cascading" input.
- In the event of a fault, it will not be possible to decelerate or brake any motors that may be running at that time.
- Adjust the thermal protection of each circuit-breaker Q_{n1} for the corresponding nominal motor current.

Components to connect depending on the types of coordination and voltages

Designation	Description
M1, M2, Mi, Mn	Motor
A1	Starter (standard applications and severe applications)
KM1, KM2, ..., KMi, KMn	Contactors
Q1	Circuit-breaker or switch/fuses
Q3	3 FA fuses
Q11, Q21, ..., Qn1	Thermal magnetic circuit-breakers
KA, KAT, KALI, KALIT	Control (separate parts XB2 or XB2 M)

Recommended application diagram for starting and decelerating several motors cascaded with a single Altistart 48, non-reversing and line contactor (continued)

Motor n control

Cascade control

(3) Assign relay R1 as the "isolating relay". Beware of the operating limits of the contacts (see Characteristics page 60521/2), for example when connecting to high rating contactors.

- BPMn: "Run" button motor n
- BPA n: "Stop" button motor n
- MST: General "Run" button
- MHT: General "Stop" button

Soft starters

Altistart 48 soft start - soft stop units

Current setting with PowerSuite on PPC

Starter factory setting

The starter is supplied ready for use in most applications. The main functions enabled and the default function values are as follows:

- Nominal motor current (depends on the starter rating)
- Limiting current: 400%
- Acceleration ramp time: 15 s
- Initial starting torque: 20%
- Selection of the type of stop: freewheel stop
- Motor thermal protection: class 10
- Time before restarting: 2 s
- Motor phase loss threshold: 10%
- Line frequency: automatic
- RUN and STOP logic inputs: 2-wire or 3-wire control via wiring
- Logic input LI3: forced freewheel stop
- Logic input LI4: local mode control (serial link disabled)
- Logic output LO1: thermal motor alarm
- Logic output LO2: motor powered
- Relay output R1: fault relay
- Relay output R3: motor powered
- Analogue output: motor current

Adjustment functions

■ **Nominal motor current** (maximum permanent current)

The nominal current of the starter can be adapted to the nominal motor current indicated on the rating plate.

Adjustment range: 0.4 to 1.3 times the starter nominal current.

■ **Limiting current**

The maximum starting current can be adjusted.

Adjustment range: 150% to 700% of the nominal motor current set and limited to 500% of the maximum permanent current defined for the starter rating.

■ **Acceleration ramp time**

During the starting phase, the Altistart 48 applies a torque ramp to the motor. The time (ACC) set corresponds to the time taken by the ramp to reach the nominal torque (starting at 0). Adjustment range: 1 to 60 s.

■ **Initial starting torque**

The initial torque tq_0 applied to the motor can be used to instantly overcome any resistive starting torque. Adjustment range: 0 to 100% of the nominal motor torque.

Acceleration ramp during time ACC with initial starting torque $tq_0 = 40\%$ of the nominal motor torque

■ **Selection of the type of stop**

Three types of stop are available for selection:

□ **Freewheel motor stop**

□ **Motor stop by deceleration via torque control (pump application)** This type of stop enables a centrifugal pump to be decelerated gradually on a ramp in order to avoid a sudden stop. It can be used to dampen the hydraulic transient in order to significantly reduce pressure surges.

The deceleration ramp time (dEC) can be adjusted.

During deceleration, the pump flow rate decreases and becomes negligible at a certain speed. To continue to decelerate would serve no purpose. A torque threshold (EdC) can be set at which the motor will change to freewheel stop mode, avoiding the unnecessary heating of the motor and the pump.

Decelerated stop by torque control during time dEC with threshold Edc for changing to freewheel stop mode
 $Edc = 40\%$ of nominal motor torque

□ **Dynamic braking motor stop (application: stopping high inertia machines)**

This type of stop will decelerate the motor if there is considerable inertia.

The braking torque level (brc) can be adjusted. The dynamic braking time (T1) corresponds to the time taken to decelerate from 100% to 20% of the nominal motor speed. To improve braking at the end of deceleration, the starter injects a d.c. current for an adjustable period of time (T2).

Dynamic braking stops for different braking torque levels brc

Soft starters

Altistart 48 soft start - soft stop units

Motor thermal protection curves (cold)

Motor thermal protection curves (warm)

Protection functions

The Altistart 48 offers functions for protecting the motor and the machine.

Calculated motor thermal protection

The starter continuously calculates the temperature rise of the motor based on the nominal current which has been set and the actual current absorbed. In order to adapt the Altistart to individual motors and applications, several protection classes are offered in accordance with standard IEC 60947-4-2:

class 30, class 25, class 20 (severe application), class 15, class 10 (standard application), class 10 A, sub-class 2.

Different protection classes are defined for the starting capacities of the motor:

- cold start without thermal fault (corresponding to a stabilised motor thermal state, motor switched off)
- warm start without thermal fault (corresponding to a stabilised motor thermal state, at nominal power)

The motor thermal protection function can be disabled.

After the motor has stopped or the starter has been switched off, the thermal state is calculated even if the control circuit is not energised. The Altistart thermal control prevents the motor from restarting if the temperature rise is too high. If special motors are used which do not have thermal protection via curves, provide external thermal protection via probes or thermal overload relays.

The starter is factory-set to protection class 10.

The tripping curves are based on the relationship between the starting current I_s and the (adjustable) nominal motor current I_n .

Trip time (cold)

Trip time for a standard application (class 10)			Trip time for a severe application (class 20)		
$I_s = 3 I_n$	$I_s = 4 I_n$	$I_s = 5 I_n$	$I_s = 3.5 I_n$	$I_s = 4 I_n$	$I_s = 5 I_n$
46 s	23 s	15 s	63 s	48 s	29 s

Trip time (warm)

Trip time for a standard application (class 10)			Trip time for a severe application (class 20)		
$I_s = 3 I_n$	$I_s = 4 I_n$	$I_s = 5 I_n$	$I_s = 3.5 I_n$	$I_s = 4 I_n$	$I_s = 5 I_n$
23 s	12 s	7.5 s	32 s	25 s	15 s

Reset motor thermal state

Activating the function resets the motor thermal state calculated by the starter to zero.

Motor thermal protection with PTC probes

The starter integrates the processing of PTC probes, thus avoiding the use of an external device. The "PTC probe thermal overshoot" fault or alarm can be indicated using a configurable logic output or displayed via the serial link. The function can be disabled.

Note: The "PTC probe protection" and "calculated motor thermal protection" functions are independent and can be active simultaneously.

■ **Starter ventilation:** The cooling fan on the starter is switched on as soon as the heatsink temperature reaches 50°C. It is switched off when the temperature returns to 40°C.

Starter thermal protection

The starter is protected against thermal overloads by an analogue thermal probe.

Motor underload detection (ULL)

Motor overcurrent detection (OIL)

Configuring the starter overload and underload with PowerSuite on a PC

Protection functions (continued)

■ Motor underload protection

The starter detects a motor underload if the motor torque falls below a preset torque threshold (LUL) for a specific (adjustable) period of time (tUL). The motor underload threshold can be set between 20% and 100% of the nominal motor torque. The permissible underload duration can be set between 1 and 60 s. The detection function can trigger an alarm or a fault. The detection function can be disabled. The "motor underload detected" alarm can be indicated by a configurable logic output and/or displayed via the serial link in the state of the starter. The "motor underload detected" fault (ULF) locks the starter and can be displayed via the serial link.

■ Excessive acceleration time protection

This protection function can be used to detect a start which takes place in adverse conditions. Examples of such conditions include a locked rotor or a motor unable to reach its nominal rotation speed. If the start duration is greater than the value set (between 10 and 999 s), the drive changes to fault mode. The function can be disabled.

■ Current overload protection

The starter detects a current overload if the motor current exceeds a preset overcurrent threshold (LOC) for a specific (adjustable) period of time (tOL). The overcurrent threshold can be set between 50% and 300% of the nominal motor current. The permissible overcurrent duration can be set between 0.1 and 60 s. This function is only active in steady state. The detection function can trigger an alarm or a fault. It can also be disabled. The "current overload detected" alarm can be indicated by a configurable logic output and/or displayed via the serial link. The "current overload detected" fault (OLC) locks the starter and can be displayed via the serial link in the state of the starter.

■ Protection against line phase inversion

This function can be used to detect the direction of rotation of the motor phases and, if it is enabled, to indicate a fault when the direction of rotation is reversed.

■ Time before restarting

This function can be used to avoid several consecutive starts which may cause:

- the thermal overheating of the application, which is not permitted
- a thermal fault which will require maintenance work to be carried out
- overcurrents (if the direction of rotation is reversed) or repeats (run/stop commands)

Following a stop command, the motor can only restart once the preset time delay has elapsed. The motor is restarted once the time delay has elapsed if a run command is still valid or if a new run command is sent. Adjustment range: 0 to 999 s.

■ Motor phase loss detection

The function is used to adjust the sensitivity of the protection function in order to detect a loss of current or a low current in one of the three motor phases for at least 0.5 s or in all three motor phases for at least 0.2 s. The value of the minimum current level can be set between 5% and 10% of the starter nominal current.

■ Automatic restart

After locking on a fault, the function permits up to six restart attempts at intervals of 60 s if the fault has disappeared and the run commands are still present. After the sixth attempt, the starter will remain locked and the fault will have to be reset before a restart is permitted. If the function is active, the fault relay remains activated if line phase loss, motor phase loss or line frequency out of tolerance faults are detected. This function can only be used in 2-wire control.

Advanced adjustment functions

■ Torque limit

Designed primarily for high inertia and constant torque conveyor applications, the function restricts the torque ramp reference to the preset value.

For example, the function can be used to limit the torque to a constant value throughout the starting period.

Adjustment range: 10% to 200% of the nominal motor torque.

■ Voltage boost level

The function can be used to avoid any "starting" torque (phenomenon caused by friction on stopping or by mechanical play). When a run command is sent, the starter applies a fixed voltage to the motor for a limited period of time before starting. The function can be disabled.

The voltage setting value varies between 50% and 100% of the nominal motor voltage.

■ Connecting the starter to the motor delta terminal

ATS48●●Q starters connected to motors with delta terminals can be wired in series in the motor windings. This type of connection reduces the current in the starter by a ratio of $\sqrt{3}$, which enables a lower rating starter to be used. The nominal current and limiting current settings as well as the current displayed during operation are on-line values and are indicated on the motor. For this application, the braking or decelerating stop functions are inactive. Only freewheel stopping is possible. The adjustment range of the nominal motor current and the limiting current are multiplied by $\sqrt{3}$ if the function is selected.

This function is not compatible with the following functions: motor phase loss detection, motor preheating, cascade, decelerated stop and dynamic braking.

Use the scheme recommended on page 60524/4 for this type of configuration.

■ Test on low power motor

This function can be used to test a starter on a motor whose power is very much lower than that of the starter. It can be used for example to check the electrical wiring of a device.

The function is automatically cancelled when the starter is switched off.

The next time the starter is switched on, the starter returns to its initial configuration.

■ Activation of the cascade function

This function can be used to start and decelerate several cascaded motors with a single starter.

In order to gain maximum benefit from torque control, it is advisable to use motors with powers between 0.5 and 1 times the power of the motor.

The wiring diagram for the cascaded motor function is shown on page 60524/6.

This function is not compatible with the following functions: motor preheating and connection to the motor delta terminal.

■ Line frequency

The following frequencies can be selected for the function:

- 50 Hz. The frequency fault monitoring tolerance is $\pm 20\%$.

- 60 Hz. The frequency fault monitoring tolerance is $\pm 20\%$.

- Automatic detection of the line frequency by the starter. The frequency fault monitoring tolerance is $\pm 6\%$.

50 Hz and 60 Hz are recommended if the power supply is provided by a generating set, given their high tolerance.

■ Reset kWh or the operating time

Sets the value of the power in kWh or the operating time value to 0. The calculation of the values is updated once the reset command has been sent.

■ Return to factory settings

The function can be used to reset each setting to its initial value (starter factory setting, see page 60526/2).

Application of a voltage boost equal to 100% of the nominal motor voltage

Soft starters

Altistart 48 soft start - soft stop units

2nd motor adjustment functions

In order to access the 2nd motor adjustment functions, one logic input must be assigned to the second set of motor parameters function. The adjustment functions and ranges are identical for both sets of motor parameters.

The settings are as follows (see page 60526/3):

- Nominal motor current
- Limiting current
- Acceleration ramp time
- Initial starting torque
- Deceleration ramp time
- Threshold for changing to freewheel stop mode at the end of deceleration
- Maximum torque limit

Communication functions

The Altistart 48 is supplied with an RS 485 multidrop serial link with Modbus protocol as standard. The serial link is configured in the Communication menu using:

- The address of the starter, which can be set between 0 and 31
- The communication speed, which can be set at: 4800, 9600 or 19200 bps
- The format of the communication data. The following formats can be selected:
 - 8 data bits, odd parity, 1 stop bit
 - 8 data bits, even parity, 1 stop bit
 - 8 data bits, no parity, 1 stop bit
 - 8 data bits, no parity, 2 stop bits
- The time-out, which can be set between 1 and 60 s

PowerSuite advanced dialogue solutions

The PowerSuite advanced dialogue solutions (see pages 60200/2 and 60200/3) offer the following advantages:

- Connection to the Altistart 48 and access to the adjustment, monitoring and control functions
- Display of messages in plain text in 5 languages (English, French, German, Spanish and Italian)
- Preparation and saving of settings to hard disk
- Comparison and editing of settings using office automation tools
- Downloading of starter settings to the PC and uploading from the PC to the starter

Application monitoring functions

The monitoring functions provide the following information:

- Cosine ϕ , displayed between 0.00 and 1.00
- Motor thermal state: 100% corresponds to the thermal state of the motor consuming the permanently set nominal current
- Motor current: displayed in amperes between 0 and 999 A and in kilo amperes between 1000 and 9999 A
- The operating time corresponding to the total number of starter operating hours during heating, acceleration, steady state, deceleration, braking and continuous bypass operation. It is displayed in hours between 0 and 999 hours and in kilo hours between 1000 and 65536 hours.
- The active power is displayed between 0 and 255%, where 100% corresponds to the power at the set nominal current and at full voltage.
- The motor torque is displayed between 0 and 255%, where 100% corresponds to the nominal torque.
- The active power consumed is displayed in kW. The line voltage value must be configured. The accuracy of this setting will depend on the error between the voltage configured and the actual voltage.
- Power in kW/h displayed with PowerSuite
- The following starter states are shown in the display of the current state:
 - Starter without run command and power not supplied
 - Starter without run command and power supplied
 - Acceleration/deceleration in progress
 - Steady state operation
 - Braking in progress
 - Starter in current limiting mode
 - Starting time delay not elapsed
 - Last fault. Displays the last fault which occurred.
 - Phase rotation direction. Displays the direction of rotation (direct or indirect).
 - **Terminal locking code**
 - An access code can be used to protect access to the adjustment and configuration parameters of the starter. Only the monitoring parameters will then be visible.

Displaying the commands and settings with PowerSuite on PC

Monitoring the parameters with PowerSuite on PPC

Assigning the logic inputs with PowerSuite on PPC

Logic input application functions

The starter has 4 logic inputs:

- **2 logic inputs (RUN and STOP) are reserved for run/stop commands** which can be sent in the form of stay-put contacts or as pulsed contacts.
 - **2-wire control:** Starting and stopping are controlled by a single logic input. State 1 of the logic input controls starting and state 0 controls stopping.
 - **3-wire control:** Starting and stopping are controlled by 2 separate logic inputs. A stop is obtained on opening (state 0) the STOP input. The pulse on the RUN input is stored until the stop input opens.

- **2 logic inputs (LI3 and LI4) can be configured with the following functions:**

- **Freewheel stop:** When combined with a braked stop or decelerated stop command, activating the logic input will stop the motor in freewheel mode.
- **External fault:** Enables the starter to detect an external user fault (level, pressure, etc.). When the contact is open, the starter changes to fault mode.
- **Motor preheating:** Used to prevent the motor from freezing or to prevent temperature variations which may cause condensation. When the logic input is activated, an adjustable current flows through the motor after a time delay which can be set between 0 and 999 s. This current heats the motor without causing it to rotate. This function is not compatible with the following functions: connection to the motor delta terminal and cascading.
- **Force to local control mode:** If a serial link is used, this function can be used to change from line mode (control via serial link) to local mode (control via the terminal).
- **Inhibit all protection:** Enables the forced operation of the starter in an emergency by overriding the main faults (smoke extraction system for example).
Warning: This type of use invalidates the starter warranty.
- **Reset motor thermal fault:** Enables the fault to be reset remotely.
- **Activation of the cascade function:** In this case, the motor thermal protection is disabled and relay R1 is configured as the fault isolation relay. Can be used to start and decelerate several motors one after the other with a single starter (see application diagram on pages 60524/6 and 60524/7).
- **Reset all faults:** Enables all faults to be reset remotely.
- **Second set of motor parameters:** Enables a second set of parameters to be selected to start and decelerate two different motors with a single starter.

Logic output application functions

The starter has 2 logic outputs (LO1 and LO2) which, depending on their configuration, can be used for remote indication of the following states or events:

- Motor thermal alarm: Indicates that the motor thermal state has exceeded the alarm threshold and can be used for example to avoid starting a motor if the thermal reserve is insufficient.
- Motor powered: Indicates that there may be current in the motor.
- Motor overcurrent alarm: The motor current is higher than the threshold set.
- Motor underload alarm: The motor torque is lower than the threshold set.
- Motor PTC probe alarm: Indicates that the thermal state monitored by the PTC motor probe has been exceeded.
- Second set of motor parameters activated

Relay and analogue output application functions

The starter has 3 relays, 2 of which are configurable.

- **End of starting relay R2:** Cannot be configured. The end of starting relay controls the bypass contactor on the starter. It is activated when the motor has completed the starting phase. It is deactivated when a stop command is sent and in the event of a fault. The starter regains control when a braking or deceleration command is sent.

■ Relay R1 application functions

Relay R1 can be configured as follows:

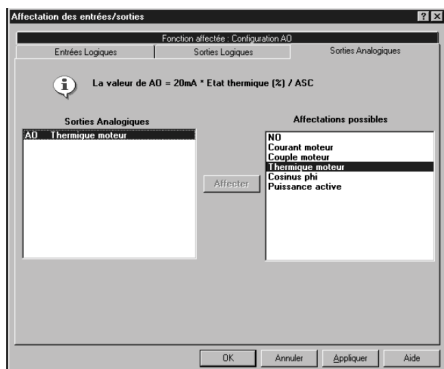

- Fault relay: Relay R1 is activated when the starter is powered and there are no faults. It is deactivated when a fault occurs and the motor switches to freewheel mode.
- Isolating relay: The contact of relay R1 closes when a run command is sent and re-opens when a stop command is sent, at the end of deceleration on a decelerated stop or in the event of a fault. The line contactor is deactivated and the motor is isolated from the line supply (see application diagram page 60524/3).

■ Relay R3 application functions

Relay R3 is configured to indicate the same states or events as logic outputs LO1 or LO2 (see above).

■ Analogue current output AO application functions

- The analogue output AO provides an image of the following values: motor current, motor torque, motor thermal state, cosine ϕ , active power.
- The following settings are associated with the analogue output:
 - the type of signal supplied: 0-20 mA or 4-20 mA
 - the scale setting of the signal. The function associates the maximum amplitude of the analogue output (20 mA) with a percentage of the nominal value of the parameter, which can be set between 50% and 500%.

Assigning the analogue output with PowerSuite on PC

Function compatibility table

Functions	Decelerating stop	Dynamic braking stop	Forced freewheel stop	Thermal protection	Motor phase loss detection	Connection to the motor delta terminal	Tests on low power motor	Cascaded motors	Motor preheating
Decelerating stop									
Dynamic braking stop									
Forced freewheel stop									
Thermal protection									(1)

- Compatible functions
- Incompatible functions
- Not applicable

(1) Motor phase loss not detected.
 (2) Thermal protection is not provided during motor preheating.

Soft starters

Conventional starting of three-phase asynchronous motors

Direct starting

- Starting current: 4 to 8 times the nominal current
- Starting torque: 0.5 to 1.5 times the nominal torque
- Characteristics:
 - Motor with 3 terminals, low and medium power
 - On-load starting
 - High current peak and voltage drop
 - Simple device
 - Sudden starting for the mechanism
- No parameter adjustment

"Star-delta" starting

- Starting current: 1.8 to 2.6 times the nominal current
- Starting torque: 0.5 times the nominal torque
- Characteristics:
 - Motor with 6 terminals
 - No-load or low resistive torque starting
 - High current peaks and torque when changing to "star-delta" mode
 - A device requiring maintenance
 - Subject to mechanical stress when starting
- No parameter adjustment

Rheostatic stator starting

- Starting current: 4.5 times the nominal current
- Starting torque: 0.5 to 0.75 times the nominal torque
- Characteristics:
 - Motor with 3 terminals, high power
 - Starting with increasing resistive torque
 - High current peak
 - A large, bulky device requiring maintenance
 - Subject to mechanical stress when starting
- No parameter adjustment

Auto transformer starting

- Starting current: 1.7 to 4 times the nominal current
- Starting torque: 0.4 to 0.85 times the nominal torque
- Characteristics:
 - Motor with 3 terminals, high power
 - Large voltage drop and current peak when connected at full voltage
 - A complex, bulky device requiring maintenance
 - Subject to mechanical stress when starting
- No parameter adjustment

Soft starters

Progressive starting of three-phase asynchronous motors

Conventional electronic starting with variable voltage and current limiting

Schematic diagram

Firing angle

Figure 1

Figure 2

- A controller with 6 thyristors connected head to tail in each line phase is used to power the three-phase asynchronous motor by gradually increasing the voltage on start-up.
- Depending on the firing time and angle of the thyristors, it can be used to supply a voltage which will gradually increase at a fixed frequency.
- The gradual increase in the output voltage can either be controlled by the acceleration ramp, or by the value of the limiting current, or linked to both parameters.

- Figure 1 shows the behaviour of the torque in relation to the starting current. Limiting the starting current I_s to a preset value I_{s1} will reduce the starting torque T_{s1} to a value which is almost equal to the ratio of the square of currents I_s and I_{s1} .

Example

On a motor with the following characteristics: $T_s = 2 T_n$ for $I_s = 6 I_n$, current limiting at $I_{s1} = 3 I_n$ or $0.5 I_s$ results in a starting torque: $T_{s1} = T_s \times (0.5)^2 = 2 T_n \times 0.25 = 0.5 T_n$.

- Figure 2 shows the torque/speed characteristic of a squirrel cage motor in relation to the supply voltage. The torque varies like the square of the voltage at a fixed frequency. The gradual increase in the voltage prevents the instantaneous current peak on power-up.

Advantages of starting with the Altistart 48

- Conventional electronic starting
To rectify problems caused by:
 - mechanical stress when starting
 - hydraulic transients during acceleration and deceleration in pump applications
 Conventional electronic starting requires the use of several current limits or the switching of several voltage ramps.
The settings become complicated and must be modified every time the load changes.
- Starting with the Altistart 48
The Altistart 48 torque control enables starting without mechanical stress and the smooth control of hydraulic transients with a single acceleration ramp.
The settings are simple and effective, whatever the load.

Soft starters

Altistart 48 soft start - soft stop units

Options: Communication modules

Presentation

The Altistart 48 can be connected directly to the Modbus bus using an RJ45 connector and communicates using the RS 485 serial link (2-wire) and the Modbus RTU protocol. The communication function provides access to the configuration, adjustment, control and signalling functions of the starter.

- 1 Modbus cable **TSX SCA 000**
- 2 Junction box **TSX SCA 50**
- 3 Subscriber sockets **TSX SCA 62**
- 4 Modbus drop cable **VW3 A8 306**
- 5 Modbus drop cable **VW3 A8 306 D30**

- 1 Communication module
- 2 Modbus hub **LU9 GC3**
- 3 Modbus drop cable **VW3 A8 306 R00**
- 4 Line terminator **VW3 A8 306 RC**
- 5 Modbus T-junction box **VW3 A8 306 TF3**
- 6 To other buses or networks

The Altistart 48 can be connected to other buses or networks using the communication modules and accessories below.

Soft starters

Altistart 48 soft start - soft stop units

Options: Remote terminal, line chokes, protective covers, documentation

VW3 G48101

Remote terminal

The terminal can be mounted on the door of a wall-fixing or floor-standing enclosure. It has the same signalling display and configuration buttons as the terminal integrated in the starter. A switch to lock access to the menu is located at the rear of the terminal.

The option comprises:

- the remote terminal
- a mounting kit containing a cover, screws and an IP 54 seal on the front panel
- a 3 m connecting cable with a 9-way SUB-D connector for connecting to the terminal and an RJ45 connector for connecting to the Altistart 48

- 1 Information is displayed in the form of codes or values in three "7-segment" displays
- 2 Buttons for scrolling through the menus or modifying values
- 3 "ESC": Button for exiting the menus (cannot be used for validation purposes)
- 4 "ENT": Validation button for entering a menu or confirming the new value selected

Description	Reference	Weight kg
Remote terminal	VW3 G48101	0.200

Line chokes

The use of line chokes is recommended in particular when installing several electronic starters on the same line supply. The values of the chokes are defined for a voltage drop between 3% and 5% of the nominal line voltage. Install the line choke between the line contactor and the starter.

Soft starters

Altistart 48 soft start - soft stop units

Selection criteria for an Altistart 48 soft start - soft stop unit

The Altistart 48 must be selected on the basis of 3 main criteria:

- Two line power supply voltage ranges are available for selection:
 - Three-phase a.c. voltage: 230 - 415 V
 - Three-phase a.c. voltage: 208 - 690 V
- The power and the nominal current indicated on the motor name plate
- The type of application and the operating cycle:
To simplify selection, the applications are categorised into 2 types:
 - Standard applications
 - Severe applicationsStandard or severe applications define the limiting values of the current and the cycle for motor duties S1 and S4.

Standard application

In standard applications, the Altistart 48 is designed to provide:

- Starting at 4 In for 23 seconds or at 3 In for 46 seconds from a cold state (corresponding to motor duty S1)
- Starting at 3 In for 23 seconds or at 4 In for 12 seconds with a load factor of 50% and 10 starts per hour or an equivalent thermal cycle (corresponding to motor duty S4)
The motor thermal protection must conform to protection class 10 (see page 60526/4).
Example: centrifugal pump

Severe application

In severe applications, the Altistart 48 is designed to provide:

- Starting at 4 In for 48 seconds or at 3 In for 90 seconds from a cold state (corresponding to S1 motor duty)
- Starting at 4 In for 25 seconds with a load factor of 50% and 5 starts per hour or an equivalent thermal cycle (corresponding to S4 motor duty)
The motor thermal protection must conform to protection class 20 (see page 60526/4).
Example: grinder

Motor duties

S1 motor duty corresponds to starting followed by operation at constant load enabling the thermal equilibrium to be reached.

S4 motor duty corresponds to a cycle comprising starting, operation at constant load and an idle period.

This cycle is characterised by a load factor of 50%.

Selecting the starter

Once the appropriate application has been selected from the following page, select the starter from pages 60522/2 to 60522/5 according to the supply voltage and the motor power.

Caution:

If the Altistart 48 is installed inside an enclosure, observe the mounting and derating recommendations (see page 60523/5).

Application areas

Depending on the type of machine, the applications are categorized as standard or severe based on the starting characteristics, which are given as examples only, in the table below.

Type of machine	Application	Functions performed by the Altistart 48	Starting current (% I _n)	Starting time (s)
Centrifugal pump	Standard	Deceleration (reduction in pressure surges) Protection against underloads or inversion of the phase rotation direction	300	5 to 15
Piston pump	Standard	Control of running dry and direction of rotation of the pump	350	5 to 10
Fan	Standard Severe if > 30 s	Detection of overloads caused by clogging or underloads (motor fan transmission broken) Braking torque on stopping	300	10 to 40
Cold compressor	Standard	Protection, even for special motors	300	5 to 10
Screw compressor	Standard	Protection against inversion of direction of phase rotation Contact for automatic draining on stopping	300	3 to 20
Centrifugal compressor	Standard Severe if > 30 s	Protection against inversion of direction of phase rotation Contact for automatic emptying on stopping	350	10 to 40
Piston compressor	Standard	Protection against inversion of direction of phase rotation Contact for automatic emptying on stopping	350	5 to 10
Conveyor, transporter	Standard	Overload control for detecting faults or underload control for detecting breaks	300	3 to 10
Lifting screw	Standard	Overload control for detecting hard spots or underload control for detecting breaks	300	3 to 10
Drag lift	Standard	Overload control for detecting jamming or underload control for detecting breaks	400	2 to 10
Lift	Standard	Overload control for detecting jamming or underload control for detecting breaks Constant starting with variable load	350	5 to 10
Circular saw, band saw	Standard Severe if > 30 s	Braking for fast stop	300	10 to 60
Pulper, butchery knife	Severe	Torque control on starting	400	3 to 10
Agitator	Standard	The current display indicates the density of the product	350	5 to 20
Mixer	Standard	The current display indicates the density of the product	350	5 to 10
Grinder	Severe	Braking to limit vibrations during stopping, overload control to detect jamming	450	5 to 60
Crusher	Severe	Braking to limit vibrations during stopping, overload control to detect jamming	400	10 to 40
Refiner	Standard	Torque control on starting and stopping	300	5 to 30
Press	Severe	Braking to increase the number of cycles	400	20 to 60

Special uses

Other criteria can influence the selection of the Altistart 48:

Starter wired to the motor delta terminal

(see the recommended application diagram on page 60524/4)

In addition to the most frequently encountered wiring layouts, where the starter is installed in the line supply of the motor and the motor is connected in star or delta configuration, the Altistart 48 ATS48***Q can be wired to the motor delta terminal in series with each winding (see the application diagram below). The starter current is lower than the line current absorbed by the motor by a ratio of $\sqrt{3}$. This type of installation enables a starter with a lower rating to be used.

Example: For a 400 V/110 kW motor with a line current of 195 A (nominal current for the delta connection), the current in each winding is equal to $195/\sqrt{3}$, i.e. 114 A. Select the starter rating with a maximum permanent nominal current just above this current, i.e. 140A (ATS48C14Q for a standard application).

To avoid making this calculation, simply use the table on page 60522/3.

This type of installation only permits freewheel stopping and is not compatible with the cascade and preheating functions.

Starter wired in series with the motor windings

Note: The nominal current and limiting current settings as well as the current displayed during operation are on-line values (so do not have to be calculated by the user).

Caution: For this type of installation, observe the wiring scheme and the associated recommendations on page 60524/4.

Starter bypassed by a contactor

(see the recommended application diagram on page 60524/3)

The starter can be bypassed by a contactor at the end of starting (to limit the heat dissipated by the starter). The bypass contactor is controlled by the starter and the current measurements and protective mechanisms remain active when the starter is bypassed.

The starter is selected on the basis of the 3 main criteria and one of the following criteria:

- If the starter is bypassed at the end of starting, the motor is always started from cold state and the starter can be oversized by one rating.

Example: Select an ATS 48D17Q for an 11 kW motor in a standard 400 V application.

- If the starter must be able to operate without the bypass contactor at the end of starting, it does not have to be derated.

Example: Select an ATS 48D17Q for a 7.5 kW motor in a standard 400 V application.

Special uses (continued)

Motors in parallel

Motors may be connected in parallel provided that the power limit of the starter is not exceeded (the sum of the motor currents must not exceed the nominal current of the starter selected depending on the type of application). Provide thermal protection for each motor.

Brush motor

The Altistart 48 can operate with a bypassed stator resistance motor or with a resistance lug. The starting torque is modified in accordance with the rotor resistance. If necessary, maintain a low resistance in order to obtain the required torque to overcome the resistive torque on starting.

A bypassed brush motor has a very low starting torque. A high stator current is required to obtain the sufficient starting torque.

Oversize the starter in order that the value of the limiting current is 7 times that of the nominal current.

Note: Ensure that the starting torque of the motor, equal to 7 times the nominal current, is greater than the resistive torque.

Note: The Altistart 48 torque control enables excellent soft starting despite the limiting current being 7 times the nominal current required to start the motor.

Dahlander motor and 2-speed motor

The Altistart 48 can operate with a 2-speed motor. A motor demagnetisation period must elapse before changing from low speed to high speed in order to avoid antiphases between the line supply and the motor, which would generate very high currents.

Select the starter using the 3 main criteria.

Very long cable

Very long motor cables cause voltage drops due to the resistance of the cable. If the voltage drop is significant, it could affect the current consumption and the torque available. This must therefore be taken into account when selecting the motor and the starter.

Starters in parallel on the same line supply

If several starters are installed on the same line supply, line chokes should be installed between the transformer and the starter (see page 60528/3).

Recommendations for use

Caution: Do not use the Altistart 48 upstream of loads other than motors (for example transformers and resistors are forbidden).

Do not connect power factor correction capacitors to the terminals of a motor controlled by an Altistart 48.
