

Chapter 2: Application layer

- 2.1 Principles of network applications
- 2.2 Web and HTTP
- 2.3 FTP
- 2.4 Electronic Mail
 - ❖ SMTP, POP3, IMAP
- **2.5 DNS**
- 2.6 P2P file sharing
- 2.7 Socket programming with TCP
- 2.8 Socket programming with UDP
- 2.9 Building a Web server

2: Application Layer 64

DNS: Domain Name System

People: many identifiers:

- ❖ SSN, name, passport #

Internet hosts, routers:

- ❖ IP address (32 bit) - used for addressing datagrams
- ❖ "name", e.g.,
ww.yahoo.com - used by humans

Q: map between IP addresses and name ?

Domain Name System:

- **distributed database** implemented in hierarchy of many **name servers**
- **application-layer protocol** host, routers, name servers to communicate to **resolve** names (address/name translation)
 - ❖ note: core Internet function, implemented as application-layer protocol
 - ❖ complexity at network's "edge"

2: Application Layer 65

DNS

DNS services

- ❑ hostname to IP address translation
- ❑ host aliasing
 - ❖ Canonical, alias names
- ❑ mail server aliasing
- ❑ load distribution
 - ❖ replicated Web servers: set of IP addresses for one canonical name

Why not centralize DNS?

- ❑ single point of failure
- ❑ traffic volume
- ❑ distant centralized database
- ❑ maintenance

doesn't **scale!**

2: Application Layer 66

Distributed, Hierarchical Database

Client wants IP for www.amazon.com; 1st approx:

- ❑ client queries a root server to find com DNS server
- ❑ client queries com DNS server to get amazon.com DNS server
- ❑ client queries amazon.com DNS server to get IP address for www.amazon.com

2: Application Layer 67

DNS: Root name servers

- ❑ contacted by local name server that can not resolve name
- ❑ root name server:
 - ❖ contacts authoritative name server if name mapping not known
 - ❖ gets mapping
 - ❖ returns mapping to local name server

2: Application Layer 68

TLD and Authoritative Servers

- ❑ **Top-level domain (TLD) servers:**
 - ❖ responsible for com, org, net, edu, etc, and all top-level country domains uk, fr, ca, jp.
 - ❖ Network Solutions maintains servers for com TLD
 - ❖ Educause for edu TLD
- ❑ **Authoritative DNS servers:**
 - ❖ organization's DNS servers, providing authoritative hostname to IP mappings for organization's servers (e.g., Web, mail).
 - ❖ can be maintained by organization or service provider

2: Application Layer 69

Local Name Server

- ❑ does not strictly belong to hierarchy
- ❑ each ISP (residential ISP, company, university) has one.
 - ❖ also called "default name server"
- ❑ when host makes DNS query, query is sent to its local DNS server
 - ❖ acts as proxy, forwards query into hierarchy

2: Application Layer 70

DNS name resolution example

- ❑ Host at cis.poly.edu wants IP address for gaia.cs.umass.edu

iterated query:

- ❑ contacted server replies with name of server to contact
- ❑ "I don't know this name, but ask this server"

2: Application Layer 71

DNS name resolution example

recursive query:

- ❑ puts burden of name resolution on contacted name server
- ❑ heavy load?

2: Application Layer 72

DNS: caching and updating records

- ❑ once (any) name server learns mapping, it **caches** mapping
 - ❖ cache entries timeout (disappear) after some time
 - ❖ TLD servers typically cached in local name servers
 - Thus root name servers not often visited
- ❑ update/notify mechanisms under design by IETF
 - ❖ RFC 2136
 - ❖ <http://www.ietf.org/html.charters/dnsind-charter.html>

2: Application Layer 73

DNS records

DNS: distributed db storing resource records (RR)

RR format: (name, value, type, ttl)

- ❑ Type=A
 - ❖ name is hostname
 - ❖ value is IP address
- ❑ Type=NS
 - ❖ name is domain (e.g. foo.com)
 - ❖ value is hostname of authoritative name server for this domain
- ❑ Type=CNAME
 - ❖ name is alias name for some "canonical" (the real) name
www.ibm.com is really servereast.backup2.ibm.com
 - ❖ value is canonical name
- ❑ Type=MX
 - ❖ value is name of mailserver associated with name

2: Application Layer 74

DNS protocol, messages

DNS protocol : **query** and **reply** messages, both with same **message format**

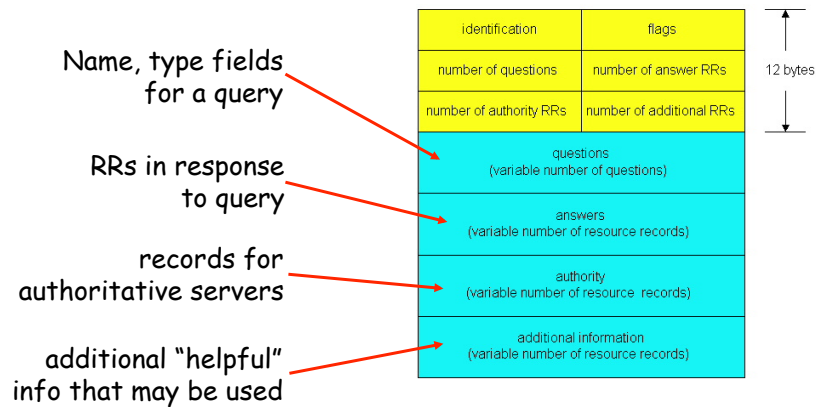

msg header

- ❑ **identification**: 16 bit # for query, reply to query uses same #
- ❑ **flags**:
 - ❖ query or reply
 - ❖ recursion desired
 - ❖ recursion available
 - ❖ reply is authoritative

identification	flags	 12 bytes
number of questions	number of answer RRs	
number of authority RRs	number of additional RRs	
questions (variable number of questions)		
answers (variable number of resource records)		
authority (variable number of resource records)		
additional information (variable number of resource records)		

2: Application Layer 75

DNS protocol, messages

2: Application Layer 76

Inserting records into DNS

- ❑ example: new startup "Network Utopia"
- ❑ register name networkutopia.com at **DNS registrar** (e.g., Network Solutions)
 - ❖ provide names, IP addresses of authoritative name server (primary and secondary)
 - ❖ registrar inserts two RRs into com TLD server:

```
(networkutopia.com, dns1.networkutopia.com, NS)
(dns1.networkutopia.com, 212.212.212.1, A)
```
- ❑ create authoritative server Type A record for www.networkutopia.com; Type MX record for networkutopia.com
- ❑ **How do people get IP address of your Web site?**

2: Application Layer 77

Let's try it out... DNS:

(submit answers via elearning platform)

Submit answers via <http://elearning.uminho.pt>

1. Which are the Name Servers and IP addresses for
 1. di.uminho.pt., uminho.pt., google.com.
2. Get Authoritative answer for the IP address of:
 1. SOA server for sapo.pt., yahoo.com., publico.pt.
 2. MX record for di.uminho.pt., up.pt.
3. Identify completely (including domain name, email address, surface address, telephone #) an hypothetical attacker:
 1. 193.136.19.190, 193.137.89.146
 2. 193.137.90.45
4. identify temporal parameters for domain "gcom.di.uminho.pt"

2: Application Layer 78

More stuff on DNS

☐ Additional materials on DNS

2: Application Layer 79

Let's try it out... DNS BIND server:
(submit GROUP ANSWERS via MOODLE)

1. Select and Download a BIND DNS server application (any version > 9.4), to install at your personal PC or Workstation
2. Install BIND s/w server at at your personal PC or Workstation
3. Using BIND, **configure a DNS service (with Primary and Secondary servers) for the domain:**
 - ❖ miebiom-gX.gcom.di.uminho.pt, using a minimal configuration setup, including SOA records, NS records, A records, PTR records and MX records
