## December 2012

## New caffeine report shows no measurable change in consumption trends of the U.S. population.

The "Caffeine Intake by the U.S. Population" report prepared for FDA presents an indepth analysis of the U.S. population's consumption of caffeine between 2003 and 2008. It focuses on different dietary sources of caffeine and consumption levels across various age groups, including children ages $2-13$, teenagers $14-21$ by gender, and women of childbearing age ( $16-45$ ). During this time, the average amount of caffeine consumed has remained constant at approximately 300 milligrams (mg) per person per day. The major food sources of caffeine are coffee, soft drinks and tea. Teenagers and young adults consumed roughly one-third the amount of caffeine as adults, or about 100 mg per day, and "energy drinks" contributed only a small portion of caffeine consumed by teenagers.

## FDA comments on <br> Subcontract Number: 70000073494, Somogyi 2010, "CAFFEINE INTAKE by the U.S. POPULATION"

FDA has noted several minor errors in the report authored on FDA contract by Laszlo Somogyi. These errors do not impact the overall results of the review, but are noted below for completeness:

- In the executive summary (ES), the NPD survey is described as being completed by "60" households. It is stated, correctly, to be 2000 on p. 50 .
- In the discussion of natural caffeine sources (p. 4), the first 4 paragraphs appear to have several minor numerical and typographical errors; data is cited (from a website medicinenet.com) that is not entirely consistent (slightly different numbers, not huge difference) with later data presented in the report.
- Several errors (some transposition errors) can be found in Tables 2-12 of the report. There are some incorrect NDB numbers and some incorrect volumes of measure (mismatch with coinciding gram amount).
- Although these may not be errors, in comparison with Version 25 of the National Nutrient Database for Standard Reference (NDB) (SR 25, the current version), the following values in SR 22 are significantly different : 14375-14353 (Table 2, p. 9; note 3680 mg caffeine per 100 g instant decaf coffee); 14366-14368 (p. 10, plus other minor errors); Table 9, p. 15-19 contains errors and a number of duplicates; Tables 10 and 11 contain minor errors.
- On p. 34 (Table 17) there is a heading "Caffeine per serving" but no values are given in the table; rather, company names are listed.
- In the data summary on p.46, the drip coffee value appears to include a 16 ounce value ( $330 \mathrm{mg} /$ serving ) rather than an 8 ounce value as stated. In the drip or percolated coffee category, the highest number is 187 $\mathrm{mg} / 8$ ounces.
- Also in the data summary on p.46, the miscellaneous drugs category does not appear to include diet pills, which contained as much as $910 \mathrm{mg} /$ serving.
- Also in the data summary on p.46, some of the categories of foods and beverages are not clearly delineated (e.g., Ready-To-Drink (RTD) tea and iced tea, chocolates and sweets). The caffeine content of Snapple was included in the range for iced tea but not RTD tea. The caffeine content of Hershey's special was not included in the chocolate category but could be contained within sweets.
- Also in the data summary on p.46, some foods/drinks appear to be missing from this table, including Chai and energy "shots."
- On p. 53, there are errors in the text of the first paragraph for males 14-21 and females 14-21.
- Pie graphs are consistent with data from Table 33, p. 63 except for Fig. 11. Correct numbers (from Table 33) are 33.7 mg coffee, 36.3 mg carbonated beverages, 15.0 mg other beverages, 16.2 mg tea. Food value ( 2.2 mg is ok). Pie chart legends are incomplete for Figs 8-10.
- In Appendix A (NPD data and "adjusted" NPD data), pie charts are consistent with tables (on preceding pages) except for Figure A3 (p. 76), which does not match Table A3 (p. 75). According to the table, the correct values should be 1.1 mg coffee, 7.5 mg tea, 10.9 mg carbonated beverages, 7.0 mg other beverages, 2.2 mg food.

## CAFFEINE INTAKE BY THE U.S. POPULATION

Prepared for:

## Executive Summary

The Food and Drug Administration (FDA) requested an in-depth analysis of the U.S. population's consumption of caffeine. In particular, the Agency was interested in the daily caffeine intake for the subpopulations of children $2-13$, male and female teenagers $14-21$, and women of childbearing age 16-45.
To complete the assignment, a two-phase study was conducted. In the first phase, levels of caffeine content of foods were compiled using the National Nutrient Database for Standard Reference (NDB) (39). Then the NDB data were extended using more focused caffeine content information collected from a comprehensive review of scientific publications, the Internet, trade association's data, and industry sources.
In the second phase, the daily caffeine intake of the U.S. population overall and of its various age and gender groups was estimated. To do so, results of the National Health and Nutrition Examination Survey (NHANES) (38) and the NPD Group's Food Consumption (34) surveys were used. The NHANES' food consumption surveys were conducted in 1999-2000, 2001-2002, 2003-2004, and 2005-2006 (38); the NPD Group' survey was compiled in 2008 from 14 consecutive days of 24-hour recall food diaries, conducted in sequence throughout the year with each two-week reporting period sequence completed by 60 households (for more details on the NDP survey process see Appendix A). The NPD data show the specific source and quantity that participants consumed daily and provide a breakdown of the overall consumption data by age and gender. In contrast, the NHANES surveys do not identify specific caffeine food sources and do not segregate intake information for females of childbearing age. Moreover, the findings of the two surveys in regard to the amount of caffeine consumed were found to be somewhat contradictory.

Accordingly, data from the two sources were validated and, if considered necessary, were updated using market information provided by The National Coffee Association (33), The Tea Association of the USA (36), and the American Beverage Association (27). U.S. trade statistics (23) are also included in our estimates because all principal sources of caffeine coffee, tea, and cocoa are imported to the United States.
From our analysis of these sources we derived the following conclusions:
More than $97 \%$ of the caffeine intake of teenagers and adults and about $95 \%$ intake of the children 2 to 13 come from beverage sources. Solid food supplies contribute only a very small amount to dietary caffeine intake. The mean daily caffeine intake of the adult population older than 22 was 300 mg in 2008. The younger age groups consumed much less caffeine because their main beverage source was cola or tea, and typical servings of those beverages contain much less caffeine than does coffee. Women of childbearing age drank less coffee than other adult groups; consequently, their daily intake of caffeine was much less than that of the overall population.

Any significant change in the caffeine intake of the U.S. population would depend on modification of coffee drinking practices, given that all other caffeine sources make only a minor contribution to overall caffeine consumption. However, according to the National Coffee Association' survey (34) consumption trend of daily cups per coffee drinker (and cups per capita) were stable in 2009.Those who drank coffee yesterday consumed an average of 3.3 cups per day, essentially unchanged since 2003’s 3.0 cups per day. Trade information is consistent
with these data as apparent U.S. consumption (i.e. imports minus export) of coffee beans was nearly constant during the past 3 years.
Energy drinks designed to increase mental alertness and physical performances for consumers by the addition of caffeine and herbal supplements such as guarana, kola nuts, and yerba maté. Energy drinks usually contain substantially more caffeine per serving than do conventional cola drinks. Of the leading brands, Red Bull contains 80 mg of caffeine per serving; Monster Energy, Rockstar, Java Monster, 160 mg each; and NOS, 260 mg . Between 2001 and 2006, market growth of these products exceeded $50 \%$ annually, but growth declined to $9 \%$ in 2008 and to $0.2 \%$ in 2009. In 2009354.5 million gallon energy drinks were sold. According to the Beverage Marketing Corporation report estimates (27) in 2008 the mean per capita daily caffeine intake from energy drinks of the U.S. population older than 10 was 7.2 mg . Reliable consumption data for habitual energy drinkers are unavailable. Assuming that $2 \%$ of the adult population is drinking energy drinks, caffeine intake of those individuals would be between 233 and 465 $\mathrm{mg} /$ day.

Energy shots a specialized kind of energy drink are the fastest-growing segment of the energy drink category. Overall, energy shots now account for 11 percent of the energy market. Whereas most energy drinks are generally sold in 12 and 16 fluid ounce ( 355 and 474 ml respectively) size cans or bottles, energy shots are usually sold in much smaller 50 ml bottles. Energy shots normally contain the same amount of caffeine, or other functional ingredients as their larger siblings, and therefore they may be considered concentrated forms of energy drinks.

## Statement of Work

Caffeine has been a component of the human diet for many centuries, primarily through the consumption of coffee and tea beverages. In the $20^{\text {th }}$ Century, consumption of carbonated soft drinks with added caffeine became commonplace. At the start of the new millennium, new beverages with added caffeine and other stimulatory natural products, such as guarana and taurine, have entered the marketplace. With the introduction of these new beverages, often targeted at young consumers, the Food and Drug Administration (FDA) is considering what, if anything needs to be done to assure that current and future consumption of these products is safe.

The FDA requested an in-depth analysis of the US population's consumption of caffeine from all sources, natural and added. In order to complete this work task, levels of caffeine naturally in or added to foods and beverages will have to be determined. The primary, but not exclusive, sources will be coffee, tea, cocoa, carbonated soft drinks, and the so-called energy drinks. Additional minor sources, as revealed by the investigators, will have to be included in the analysis. Caffeine levels should be as specific to product as possible (e.g., added caffeine in carbonated soft drinks range normally from approx. 20 to $100 \mathrm{mg} / \mathrm{kg}$ ) within the constraints of the investigation. A measure of the uncertainty surrounding the levels chosen should be included in the analysis.

In order to obtain a distribution of intakes for caffeine in the US diet, high quality and specific food consumption data will have to be combined with the caffeine levels determined for each of the foods. The NHANES (National Health and Nutrition Examination Survey) food consumption surveys (38) completed in 2005-6, 2003-4 and 2001-2002 is one database with these data. Longer frequency of intake surveys, typically used for marketing purposes, such as those completed by the NPD Group (34), can also be used with appropriate manipulation to allow individual diets to be reconstructed. The food consumption database needs to be representative of the US population and must be robust enough to allow analyses of specific subsets of the total population, as discussed below. The merits and drawbacks for the choice of food consumption database should be included in the analysis.

Because students and other young people often consume the newer energy drinks, the Agency is interested in the distributions of caffeine intake for the subpopulations of children 2-13 years old, male and female teenagers 14-21 years old, and women of childbearing age 16-45 years old. These subgroups often have much higher mean intakes of foods than the population in general or may be particularly sensitive to components of the diet.

Caffeine, whose chemical name is 1,3,7-trimethylxanthine, is a bitter white crystalline alkaloid that acts as stimulant and a mild diuretic. The beans, leaves, and fruit of more than 60 plants contain varying quantities of caffeine (3, 26); in those plants caffeine serves as a pesticide, killing or paralyzing insects that feed on the plants. Coffee, tea, and cocoa are the major plants containing caffeine that are cultivated. Guarana, kola nuts, and yerba maté are also cultivated for use as sources of caffeine in energy drinks and snacks.
Of the psychoactive substances consumed worldwide, caffeine is used the most widely. However, it is legal and unregulated unlike other psychoactives. The FDA classifies caffeine as a "Multiple Purpose Generally Recognized as Safe Food Substance" (21 CFR, Section 182.1180), with tolerance at $0.02 \%$, stating that moderate caffeine intake produces no increased risk to health.

## Sources of Caffeine

The common dietary sources of caffeine are coffee, chocolate, tea, and some soft drinks. The amount of caffeine in food products varies, depending on the serving size, the type of product, and the preparation method.

## Natural Sources (26)

Cocoa (Theobroma cacao), a major ingredient in chocolate products, contains a small amount of caffeine. Cocoa's weak stimulant effect may also be due to a combination of the theobromine and theophylline it contains, as well as caffeine. The amounts of these compounds contained in chocolate products are too small for typical servings to create effects equal to those of coffee. Chocolate bars (in a typical 28-g serving) contain from 11 to 115 mg of caffeine.
Coffee beans (Coffea sp.) from which coffee are brewed constitute the primary source of caffeine. The caffeine content in coffee varies widely, depending on the type of coffee bean and the method of preparation; even beans from a given coffee bush can vary in their caffeine concentration. Roasted coffee beans contain $0.8-2.5 \%$ caffeine. Generally, dark-roast coffee has less caffeine than lighter roasts because the roasting process reduces the bean's caffeine content. Arabica coffee normally contains less caffeine than the Robusta variety. In general, one serving of coffee ranges from 64 mg for a single cup ( 30 ml ) of espresso to about 145 mg for an $8-\mathrm{oz}$. ounce cup ( 237 ml ) of automatic drip coffee.
Guarana (Paullina cupana), grown in South America, typically contains more caffeine than coffee beans ( $2-4.5 \%$ vs. $5 \%$ ). In addition, guarana contains other stimulants such as theobromine and theophylline.

Kola nuts or Cola (Cola nitida) from trees in African rainforests also contains caffeine. Kola was once used in making cola soft drinks, but artificial flavorings are now generally used. Caffeine content ranges between 2 to $3.5 \%$; also contains theobromine at 1.$)-2.5 \%$ concentration. Some new energy drinks contain Kola nut extract (see the discussion below).
Tea (Camellia sinensis) fresh leaves contain about $4 \%$ caffeine. Tea beverages typically contain about 20 to 80 mg of caffeine per cup-about half the caffeine per serving of coffee. Black tea's caffeine content is higher than that of most other teas. Preparation affects brewed tea's caffeine content, although the color of brewed tea is not a good indicator of the amount of caffeine in the tea; for example, the Japanese green tea Gyokuro, a pale tea, contains much more caffeine than do dark teas like Lapsang Souchong, which has very little.

Taurine a functional food ingredient added to many energy drinks and energy products as a caffeine adjuvant. Caffeine and taurine are dissimilar. Whereas caffeine is a stimulant, taurine is an amino acid produced naturally by the body. Taurine supports neurological development and helps regulate blood constituents; it may also be an antioxidant.
Yerba maté (Ilex paraguariensis) contains xanthenes-stimulants in the same family as caffeine, theophylline, and theobromine, all of which found in coffee and chocolate. Yerba maté's caffeine content ranges from $0.3 \mathrm{wt} \%$ to $1.7 \mathrm{wt} \%$ dry. In addition it contains theobromine at $0.3-0.9 \%$ level. Although yerba maté products are sometimes marketed as "caffeine-free" alternatives to coffee and tea, such claims are based on assuming that "mateine"-the primary active xanthine in maté -is a caffeine stereoisomer. That is a chemical impossibility, however; in fact, chemical databases treat "mateine" as a caffeine synonym.

## Commercial Sources with Added Caffeine

Caffeine is commonly added to soft drinks-typically, from 30 to 40 mg of caffeine per 12 oz . ( 355 ml ) serving. The caffeine in these drinks originates either from the ingredients used or is an additive derived from the decaffeination of coffee or from chemical synthesis.
Energy drinks, with added caffeine, vitamins, taurine, guarana, kola nut, Yerba maté and herbal supplements, are sold to improve drinkers' performance and alertness. The additional ingredients may act in synergy to provide a stimulant effect greater than that provided by caffeine without them. In contrast to typical soft drinks, some contain as much as 200 mg of caffeine per 12 fl . oz. ( 355 ml ) serving. In addition many energy drink brands are sold in larger serving size containers (16-20 fl. oz. - 474-592 ml).

Energy shots are a specialized kind of energy drink. Whereas most energy drinks are generally sold in 12 to 16 fluid oz. cans or bottles, energy shots are usually sold in 2 fluid oz. plastic bottles. Energy shots normally contain the same amount of caffeine, or other functional ingredients per container as their larger counterpart, and therefore they may be considered concentrated forms of energy drinks accounting for 11 percent of the energy drink market. As of June 2009, there are approximately 250 energy shot brands in the US, with Chaser 5 -Hour Energy owning 78\% of the market share. Energy shots are the fastest-growing part of the energy drink category and are stealing the momentum from their bigger - in package size - rivals (27). A niche is emerging within the energy shot space called micro shots. These are shots with 1-5 teaspoons of liquid.

Caffeinated alcoholic beverages are energy drink mixes with alcohol. Prior to 2008 over 40 products were marketed in the U.S. Various consumer groups complained that caffeine a stimulant reduced the drinkers' sense of intoxication and were marketed to young drinkers who were already more likely to have risky behavior in driving and other activities. In November 2009 The Food and Drug Administration notified manufacturers of caffeinated alcoholic beverages that they would have 30 days to prove "clear evidence of safety," or this product line would have to be taken off the market. At the time of preparation of this report it is unknown how many of these products are still sold. However, the leading brands Miller/Coors' Sparks and Anhaeuser Busch's Tilt that previously contained caffeine and guarana presently sold without any caffeinated ingredient.

In the United States, federal regulations stipulate that food, beverage and dietary supplement labels must list all ingredients, but the regulations do not require labeling the amount of caffeine in products. Table 1 lists the ingredients commonly listed on that the food and beverage labels that contain caffeine.

Table 1
Common Caffeine-Containing Ingredient and Label Terms

| Common Name, Ingredient | Label Terms Identified |
| :--- | :--- |
| Caffeine | Caffeine, Caffeine anhydrous, Caffeine citrate, <br> Citrated caffeine, Methylxanthine, Trimethylxanthine |
| Cocoa, cacao | Cocoa, Theobroma cacao, chocolate |
| Coffee | Coffee, caffeine |
| Green tea, black tea | Green tea, black tea, green tea extract, Camellia sinensis, <br> Theo sinensis, Camellia sp. |
| Guarana | Guarana, Paullina cupana, Brazilian cocoa |
| Kola nut | Kola nut, cola seeds, Cola nitida |
| Yerba maté | Yerba maté, mate, Ilex paraguariensis |

## 1. Caffeine Content of Food and Beverage Products

This section sets forth the caffeine content of food and beverage products. Two sets of data are presented:

1. Information based on the National Nutrient Database for Standard Reference (NDB) of the USDA's Nutrient Data Laboratory (39)
2. A wider range of values compiled from scientific publications, the Internet, trade associations data, and industry sources.

## The National Nutrient Database (NDB)

The NDB provides broad information on food and beverage composition. NDB is well organized and conveniently accessible on the Internet. NDB Release 21 (39) which was issued in September 2008 includes nutrient value information for about 130 nutrients for 7,412 different foods and beverages, including caffeine values for 4,024 products. ${ }^{1}$
Despite this large volume of information, we found the NDB data to be of limited value for caffeine consumption studies because the NDB's primary objective is to provide information about the major essential nutrient food components. Because caffeine has no known nutritional role, the NDB data include only a few values for the primary dietary sources of caffeine-coffee, tea, cola, and energy drinks-but do present ample information for products (e.g., chocolates and sweets, snacks, dairy products) whose dietary contribution of caffeine is inconsequential. For example, the NDB provides caffeine content information for 209 chocolate items, which represent minor contributions to caffeine intake, but includes caffeine data for only 16 primary caffeine sources such as coffee and tea. Moreover, the NDB includes only one energy drink. Our research revealed that more than 150 energy drink products are currently sold in the United States.

The caffeine consumption estimates of the CDC's National Health and Nutrition Examination Study (NHANES) (38) survey and of the NPD Group (34), a Chicago based private market research firm, which are based on the NDB data, are shown below. We then supplement the NDB caffeine content data with more focused caffeine content data collected as part of the study. We believe the latter data series are more suited for estimating caffeine intake.

[^0]
## The Caffeine Content of Food and Beverages Covered in the NDB

Tables 2 through 13 present the caffeine contents of food and are compiled from the NDB (39). Data related to all caffeine-containing products were collected from the NDB, and assembled in the following 11 product groupings:

| Coffee | Chocolate-flavored beverages |
| :--- | :--- |
| Tea | Sweets |
| Carbonated beverages | Snacks |
| Alcoholic beverages | Fast foods |
| Energy drinks | Baked products |
| Dairy products |  |

For each product, the tables present the following information:

- NDB reference number
- $\quad$ Name and description of the product
- $\quad$ Serving size—one or two alternative measures
- Caffeine content per serving
- Caffeine content in milligrams in 100 g of product.

Table 2
Caffeine Content of Coffee

|  |  | Measure 1 |  |  | Measure 2 |  |  | In $100 \mathbf{g}$ <br> Caffeinel mg |

## Caffeine Content of Food and Beverage Products, Based on Comprehensive Data Search

The author augmented NDB nutrient database by compiling information in the public domain on the caffeine content of foods, beverages, drugs and dietary supplements. This information was assembled by reviewing technical publications and the Internet for pertinent data, and by conducting telephone interviews with trade associations and industry experts.

Caffeine content data are presented in Tables 13-24, arranged by the following product segments:

- Coffee beverages: Tables 13
- Tea beverages: Tables 14
- Carbonated beverages: Tables 15
- Energy drinks and energy shots: Table 16
- Caffeinated Alcoholic beverages: Table 17
- Caffeinated waters: Table 18
- Dairy products: Table 19
- Chocolates, and foods and confectionaries containing chocolate: Table 20
- Miscellaneous snack foods, gums and mints: Table 21
- Drugs $^{1}$ : Table 22
- Weight loss pill supplements ${ }^{1}$ : Table 23
- $\quad$ Caffeine Pill Product1 ${ }^{1}$ : Table 24

Please note that many product names, particularly those for energy drinks (Table 16), are not spelled according to standard rules. These product names are presented exactly as they are appear on the product label and are not misspelled.

## Table 14 (concluded) Caffeine Content of Tea Beverages

| Representative Tea Products | Serving Size <br> Fluid oz. | Caffein per Serving mill | tent $\text { in } 100 \text { ml }$ |
| :---: | :---: | :---: | :---: |
| Lipton Iced Teas ${ }^{11}$ | 16 | 40 | 8 |
| Morning Thunder Tea | 8 | 40 | 17 |
| Nestea | 12 | 26 | 7 |
| Nestea Iced Tea | 16 | 34 | 7 |
| Nestea Peach Green Tea | 20 | 42.4 | 7 |
| Nestea Pure Lemon Sweetened | 16 | 22 | 5 |
| Nestea Sweetened Lemon Ice Tea | 20 | 27.5 | 5 |
| Oregon Chai concentrate | 4 | 32.5 | 28 |
| Pacific Chai | 12 | 100 | 28 |
| Snapple Elements | 18 | 108 | 20 |
| Snapple Iced Tea Regular or Diet ${ }^{12}$ | 16 | 42 | 9 |
| Snapple, Just Plain Unsweetened | 16 | 18 | 4 |
| Snapple, Kiwi Teawi | 16 | 10 | 2 |
| Starbucks Tazo Chai Latte Grande | 16 | 100 | 21 |
| Lipton Brisk, all varieties RTD | 12 | 9 | 3 |
| Arizona Iced Tea black RTD | 16 | 32 | 7 |
| Arizona Iced Tea green RTD | 16 | 15 | 3 |
| Crystal Light Iced Tea, RTD | 8 | 11.25 | 5 |
| Lipton Brisk, all varieties RTD | 12 | 9 | 3 |

${ }^{1}$ Lipton markets a wide range of tea based RTD beverages. The caffeine content of each flavor is different - making it difficult to generalize. However an average is about 40 mg caffeine per 160 z serving.
${ }^{2 /}$ Snapple produces large variety of different tea flavors. New flavors are constantly being produced, and old flavors are often discontinued at any time. Caffeine content varies however; most of the teas contain 42 mg of caffeine per 16 oz . serving.

| V2 Vodka with Caffeine, | Wingard USA (Importer) |
| Vicious Vodka with Caffeine | LeVecke Corporation |
| Wide Eye | Constellation Brands |
| XZO Vodka with Caffeine, Taurine, and Guarana | Rizer Spirits Inc. |

${ }^{1}$ In November 2009 The Food and Drug Administration notified manufacturers of caffeinated alcoholic beverages that they would have 30 days to prove "clear evidence of safety," or this product line would have to be taken off the market. At the time of preparation of this report it is unknown how many of these products are still sold. However, the leading brands Miller/Coors' Sparks and Anhaeuser Busch's Tilt that previously contained caffeine and guarana presently sold without any caffeinated ingredient.

## Table 18

Caffeine Content of Caffeinated Waters

| Energy Drinks | Serving Size Fluid Oz. | Caffeine Content |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | per Serving milligram | $\begin{gathered} \text { In } 100 \\ \mathrm{ml} . \end{gathered}$ | Source ${ }^{1}$ |
| Aqua Blast | 16.9 | 90 | 18 | C |
| Aqua Java | 16.9 | 50-60 | 10-12 | C |
| Clearly Canadian Daily Energy | 20 | 80 | 16 | C, T |
| Java Water | 16.9 | 125 | 25 | C |
| Krank 20 | 16.9 | 100 | 20 | C |

| Fast foods | Misc. | 1-77 | 1-49 |
| Baked products | 1 oz or 1 portion | 1-28 | 1-46 |
| Drugs |  |  |  |
| Miscellaneous Dugs | 1 or 2 tablet or capsule | 15-200 | NA |

*Some extremely large values for insignificant products are excluded.

## 2. Caffeine Intake by the U.S. Population

Estimates of the caffeine intake of the U.S. population are based on the following two sources:
1.USDA NHANES 2-day food consumption surveys (38),
2.The NPD Group's Food Consumption surveys (34) compiled from food diaries of an annual panel of 2,000 households, which yields about 5,000 individuals each year for two years.. Households are selected from across the nation and matched to U.S. Census statistics to ensure that the sample is representative of the U.S. population.

Data from these sources were validated and, if considered necessary, were updated from market information provided by The National Coffee Association (33), The Tea Association of the USA (36), and the American Beverage Association (27). U.S. Trade Statistics (23) are also included in our estimates because all principal sources of caffeine coffee, tea, and cocoa are imported to the United States.

## Caffeine Intake of the U.S. Population, Based on the NHANES Surveys

The U.S. Department of Health and Human Services and the USDA jointly conduct What We Eat in America (WWEIA), and NHANES, a national food survey (38). The National Center for Health Statistics conducts the ongoing NHANES nationwide surveys, with data released in 2-year increments: 1999-2000, 2001-2002, 2003-2004, and 2005-2006. The respondents interviewed by NHANES-all of whom are in the U.S. civilian population-are selected using a complex sampling method. In the 2-year increment, approximately 10,000 individuals were interviewed. For WWEIA, respondents recall their food consumption over 24 hours (see http://www.ars.usda.gov/ba/bhnrc?fsrg for more detailed information).
The data for 2005-2006, the most data release, represent 24-hour recall for 2 nonconsecutive days for about 9,500 respondents. The survey includes respondents’ caffeine intake. However, note that the survey is not specific for caffeine intake; caffeine is only one of the 63 food components included in the analysis. Moreover, information on the sources of caffeine is not provided; instead, the NHANES reports indicate statistics only for total daily caffeine consumption.

Table 26 presents results for per capita (includes eaters and non-eaters) caffeine intake for the last three 2 -year periods; Figure 1 illustrates per capita mean daily caffeine intakes by age and gender groups for 2005-2006.

Table 26
Caffeine Intakes from Food and Beverage: Mean Amounts Consumption Per Capita in One Day

| Gender and Agel Years | 2001-2002 |  | 2003-2004 |  | 2005-2006 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Figure 1

Source: USDA, Agricultural Research Service, NHANES 2005-2006 survey.

Per capita caffeine consumption (includes eaters and non-eaters) between 2001 and 2006 for all consumers older than 2 ranged from 142.1 to $149.8 \mathrm{mg} /$ day, indicating only very small variation over the period.

Females and males between 2 and 19 consumed much less caffeine than adults did, given youth's preference for cola beverages, which contain much less caffeine than coffee. In 2006, per-capita mean daily caffeine intake by young children 2 to 5 and 6 to 11 years from all caffeine containing sources was 8.4 and $19.7 \mathrm{mg} /$ day for boys and 6.9 to $17.0 \mathrm{mg} / \mathrm{day}$ for girls.

In each 2-year survey period, female adults consumed less caffeine than males. Moreover, females of childbearing ages between 20 and 49 consumed less caffeine than males in the same age group. However, the latest 2005-2006 survey showed that per-capita caffeine intake of females in the 30-39 year age range was double that of the 20-29 age female groups$165.2 \mathrm{mg} /$ day vs. $82.2 \mathrm{mg} /$ day intake-and increased even further to $219.8 \mathrm{mg} /$ day for females 40-49 years old. (Note that the survey does not provide a specific breakdown for
women 40 to 45 who are still of childbearing age. Nor does the NHANES survey provide information about the sources of caffeine consumption; therefore, it is unknown whether the increase was due to coffee, tea, or soft drink consumption.)

Each 2-year survey indicated that males 40-59 years old consumed the highest daily doses of caffeine, followed by a substantial decrease for males in older age groups.

The highest per-capita caffeine intake in 2005-2006 was 295.6 mg /day for the 50-59 age groups.

These results are similar to those in a report by Knight et al. dated 2004 (25). In that report, intake of major beverage sources (coffee, tea, and carbonated soft drinks containing caffeine) was measured for 10,712 consumers in the 1999 U.S. Share of Intake Panel, a targeted beverage survey; the survey did not include energy drinks, chocolate, or other food sources of caffeine. In the study, daily caffeine intake of all consumers (all ages) from caffeinated beverages was $120 \mathrm{mg} /$ day (mean) with $287 \mathrm{mg} /$ day at the $90^{\text {th }}$ percentile, ranging from 106 to $170 \mathrm{mg} /$ day (mean) and $227-382 \mathrm{mg} /$ day at $90^{\text {th }}$ percentile. The mean caffeine intakes for children 1-5 and 6-9 years were 14 and $22 \mathrm{mg} /$ day, respectively; at the $90^{\text {th }}$ percentile intakes were 37 and $45 \mathrm{mg} /$ day, respectively. Women of reproductive age (20-34 years) ingested 91 to $109 \mathrm{mg} /$ day (mean) caffeine and 229 to $247 \mathrm{mg} /$ day at $90^{\text {th }}$ percentile.

## Caffeine Intake of the U.S. Population, Based on the NPD Group Survey

The NPD Group’s Nutrition Service surveyed respondents’ food and beverage consumption, recorded in daily diaries. The sample surveyed consisted of the National Eating Trend's (NET's) annual panel of 2,000 households, which represented about 5,000 individuals each year. Households were selected from across the nation and matched with U.S. Census statistics to ensure that the sample was representative of the U.S. population. Food and beverage consumption was recorded and returned daily for each household member for 14 consecutive days. Each meal and snack, both at home and away from home, was recorded. To ensure all days were given equal weight and seasonal behavior was captured, approximately 2,000 households representing approximately 5,000 individuals for each year began new 2-week reporting periods sequentially throughout the year.

NPD's Nutrient Intake Database estimates an individual's daily intake of calories, protein, fats, carbohydrates, vitamins, minerals, and caffeine. The database calculates nutrient intake data by integrating eating frequency from NET, with average serving sizes from WWEIA (the dietary intake interview component of NHANES), and nutrient values from the USDA's National Nutrient Database for Standard Reference.

In brief, the NPD data provide food intake for 14 days for each sampling conducted throughout the year. The NPD data indicate the specific source and quantity that participants consume daily and break down overall consumption data by age and gender segments. In contrast, NHANES surveys gathered dietary recall data for 1 day and are conducted one time each year, and they did not segregate intake information for females of childbearing age.

Table 27 shows daily consumption quantities of caffeine-containing foods and beverages extracted from the NPD Group's 2-year consumption survey issued in February 2008. Our caffeine intake estimates that follow are based on these food and beverage consumption data. For example, the data show that all person older than 2 typically consumed $145.8 \mathrm{~g} /$ day of coffee, $126.5 \mathrm{~g} /$ day of tea, and $204.0 \mathrm{~g} /$ day of caffeine-containing carbonated soft drinks.

Table 27
Mean Daily Consumption of Caffeine Containing Food and Beverage Products Identified as Caffeine Sources

| Food or Beverage Source* | Mean Single Day Food and Beverage Consumption per Person, in Grams |  |  |  |  |  |

| Pudding/Custard/Tapioca | 4.3 | 4.1 | 5.0 | 2.5 | 4.4 | 2.8 |

[^8]The NPD Group's caffeine intake estimates were less than one-half those of other surveys. In analyzing the NPD data, we found that the calculated caffeine contents for several products were much lower that generally accepted for caffeine-containing beverages. Therefore, we used the NPD data for the quantity of caffeine-containing foods and beverages consumed, but substituted NPD's caffeine content figures from data we collected as part of this study from technical publications, the Internet, trade associations, and industry sources.
Tables 28 and 29 summarize the adjusted daily caffeine intake estimates; Figure 2 illustrates the same data. The data show daily caffeine intake estimates by age and gender groups based on the NPD survey. The Appendix sets forth a complete account of the original NPD report.

Figure 2

Source: NPD Group's Nutrient Intake Database, February 2008, with caffeine content of food and beverage data adjusted by the author.
Total Sample: 9,432 Individuals, 2 years of age and older.

For all age groups, solid foods are negligible sources of caffeine; caffeine intake from solid foods represents 3.3 to $7.7 \%$ for young people between 2 and 21 , and less than $2 \%$ for male and female adults. For all age and gender groups coffee, tea, and carbonated beverages are the major sources of caffeine. Caffeine intake increases dramatically with age. Children aged 2-13 per capita consume $28.7 \mathrm{mg} /$ day of caffeine; per capita consumption increases to 47.9 to $60.0 \mathrm{mg} /$ day among 14 to 21 year olds. Per capita daily caffeine consumption of adults older than 22 is $161.9 \mathrm{mg} /$ day, with women of childbearing age consuming much less caffeine at $115.6 \mathrm{mg} /$ day. Coffee is the largest source of caffeine among adults, followed by tea; more than $50 \%$ of the daily caffeine intake of adults is from coffee beverages. Soft drinks and tea are major caffeine sources for children 2 to 13 ; for that age group, as well as for the 14-21 groups, carbonated beverages (mostly cola) provide the largest source of caffeine. Moreover, younger age groups consume more tea per capita than coffee.

## Coffee Consumption Estimates by the National Coffee Association of U.S.A. (NCA)

According to the NPD survey, coffee beverages are the most important sources of caffeine, accounting for more than $50 \%$ of caffeine intake for the adult U.S. population. Therefore, thorough knowledge pertaining to coffee consumption and trends is essential. Comprehensive information regarding coffee consumption is available from NCA. Since 1950, NCA has commissioned annual surveys on the coffee drinking quantities consumed and consumption trends among American consumers. In contrast to the NPD survey, which collects information on a broad number of food components, the NCA annual survey focuses
only on coffee consumption. Therefore, it is a more thorough and reliable source for coffee consumption.
The July 2009 NCA report (33), which is quoted here, incorporates a random telephone dialing survey of 2,956 males and females, 18 years of age or older. The report includes consumption figures for all common coffee types such as regular, instant, decaffeinated, and gourmet coffee beverages (e.g., cappuccino, espresso, latte, café mocha, iced coffee). Data collection was conducted during January and February 2009. The samples are representative of the population of the continental U.S, $(225,849,000$ age 18 years or older) of whom $54 \%$ drank coffee on the previous day of the survey. The results indicate that previous-day coffee consumption has been relatively stable since the late 1980s; the all-time peak of $57 \%$ occurred in 2007.

While daily coffee consumption among Americans held steady, the data for past week and past year coffee consumption was down from 2008, indicating that a small number of less frequent coffee drinkers may have moved away from coffee consumption. Among the surveyed Americans 63\% drank coffee in the previous week and $77 \%$ drank coffee during the past year. During recent years, past week consumption declined slightly from the all-time high of $68 \%$ in 2006. Consistent with data for coffee drinkers in the past week, yearly consumption of the surveyed population decreased from the high of $82 \%$ in 2006 to $77 \%$ in 2009.

According to the NCA report overall 22\% of the adult population does not ever drink coffee. Non drinkers tend to be younger, live in the South region, and more likely to drink soda and milk.
About $10 \%$ of the adult coffee drinker population drank decaffeinated coffee on the previous day, indicating that decaffeinated coffee consumption did not change since 2005. Among coffee drinkers, $11 \%$ drank decaffeinated coffee during the previous week in 2009, with past year's consumption was significantly higher at $29 \%$.
In 2009, previous day coffee drinkers (equal to $54 \%$ of 18 years and older population) consumed an average of 3.3 cups per day (equivalent to 26.4 fl . oz. or 780.7 ml ). Consistent with the overall consumption trend, daily consumption quantities remained essentially unchanged since 2003, when the coffee drinker population segment drank 3.0 cups of coffee each day. This finding indicates that those drinking coffee are not reducing the number of cups they consume each day.
Table 30 and Figure 3 show daily coffee consumption of various coffee drinker age groups and their daily caffeine intake. According to NCA data, the daily intake of each coffee drinking group exceeds 300 mg of caffeine. Each annual NCA survey since 1974 has found daily consumption by regular coffee drinkers to be 3 to 3.6 cup of coffee, and the author views those figures as reasonable estimates. Heavy coffee drinkers can be assumed to seldom drink tea and to consume fewer carbonated soft drink products, with most of their daily caffeine source therefore coming from coffee drinks.

Table 30
Daily Coffee Consumption and Caffeine Intake by Regular Coffee Drinkers; NCA Survey, winter, 2009

|  | Daily Coffee Consumption |  | Daily Caffeine <br> Intake |
| :---: | :---: | :---: | :---: |
| Age Group | 8-Fl. Oz. <br> Cups | Volume <br> milliliters | Milligrams* |
| $18-24$ | 2.9 | 686.1 | 329.3 |
| $25-39$ | 3.0 | 709.8 | 340.7 |
| $40-59$ | 3.6 | 851.7 | 408.8 |

| All Drinkers | 3.3 | 780.7 | 374.7 |

Source: National Coffee Association, New York, NY 2009.
*The author calculated caffeine intake figures as 48 mg of caffeine in 100 g of coffee.

Figure 3

[^9]The NHANES survey provides a summation of caffeine intake from all dietary sources; it does not reveal specific information about the source of caffeine consumption. The survey indicates daily consumption of 149.8 mg from all caffeine sources for the 2 year old and older U.S. population. Although the NPD report includes specific coffee consumption estimates for the entire U.S. population older than 2 years, the NCA study addresses only the segment of the population older than 18. Because the 2 to 18 age group consumes only very small amounts of coffee, a reasonable comparison may be made between the NPD and NCA data. When we have extended our estimate based on the NCA coffee consumption data to the entire U.S. population (e.g., including coffee drinkers and nondrinkers over 18) per capita coffee consumption was 1.76 cups/day per person (equivalent to 14 fl . oz. per day or $416 \mathrm{ml} /$ day). Per capita consumption by males and females was almost equal, at 1.78 daily cups and 1.73 daily cups, respectively.

Table 31 and Figure 4 summarize per capita daily coffee consumption and caffeine intake including all members of various age groups; the data were derived from the NCA report extended to the entire U.S. Population.

Table 31
Daily Per-Capita Coffee Consumption and Caffeine Intake of Various Age Groups from the NCA's 2009 Survey

|  | Daily Coffee Consumption |  | Daily Caffeine Intake |
| :---: | ---: | ---: | ---: |
| Age Group | 8-FI. Oz. Cups | Volume milliliters | Milligrams |
| $18-19$ | 0.73 | 172.7 | 82.9 |
| $20-24$ | 0.92 | 217.7 | 104.5 |
| $25-29$ | 0.95 | 224.8 | 107.9 |
| $30-39$ | 1.46 | 345.4 | 165.8 |
| $40-49$ | 2.03 | 480.3 | 230.5 |
| $50-59$ | 2.25 | 532.3 | 255.5 |
| $60-69$ | 2.14 | 506.3 | 243.0 |
| $70+$ | 2.08 | 492.1 | 236.2 |
| Population over age $18^{*}$ | 1.76 | 416.4 | 200.0 |

Source: National Coffee Drinking Trends, 2009. National Coffee Association of U.S.A.,
*Data reported are for correspondents 18 years of age or older. Until 1999, the survey included the 1014 and 15-19 age groups. In 1999, the 10-14 age group consumed 0.15 cup ( 1.2 fl . oz.) of coffee per day and the 15-19 age group consumed 0.59 cup per day ( 4.72 fl . oz.).

## Figure 4

Source: National Coffee Drinking Trends, 2009. National Coffee Association of U.S.A., New York, NY (33)

## Trade Information

Essentially, all dietary caffeine available in the United States is imported, primarily in the form of coffee, but also as tea, cocoa, and purified caffeine itself. Thus, reviewing recent trade data (51) provide another perspective on caffeine consumption. Recent apparent consumption (i.e., imports, minus exports) data can provide useful information on the extent of coffee consumption and help validate the estimates that the NPD and NCA surveys provide.

## Coffee

Apparent U.S. consumption of coffee was nearly constant during the past 3 years. Using the past 3 years' trade data and the following method, we estimated per capita caffeine intake at $184.5 \mathrm{mg} /$ day for the population 2 years and older:
In 2006, 2007, and 2008, apparent consumption was $1,119,437,1,169,634$ and 1,174,992 metric tons (MT) of coffee beans, respectively.
Thus, the annual apparent consumption during the past 3 years was $1,154,688$ MT of coffee beans.

- The caffeine content of roasted coffee beans ranges between 0.8 and $2.5 \%$.
- Using the median $1.65 \%$ caffeine content for coffee beans, the annual caffeine intake of the entire U.S. population was 19,052 MT.
- Per capita daily caffeine intake of the population older than two years (283 million in 2008) was 184.5 mg .
- Caffeine intake of regular daily coffee drinkers representing $54 \%$ of the population (33) was therefore 341.7 mg . Assuming proximately $5-10 \%$ waste and other losses regular coffee drinkers' daily caffeine consumption is between 313 mg to 325 mg caffeine from coffee drinking.

The low caffeine consumption of $67.2 \mathrm{mg} /$ day for adults indicated in the NPD survey is debatable. The close agreement in caffeine intake estimates derived from the U.S. trade data and the NCA survey supports this assumption. The NCA coffee intake survey indicates that the U.S. population older than 18 has a daily caffeine intake of $200.0 \mathrm{mg} /$ day. From U.S. trade data, we arrive at a caffeine intake for the U.S. population older than 2 of 184.5 $\mathrm{mg} /$ day. We believe that these relatively consistent figures are reliable estimates. Therefore, in the Conclusions Section of this report we present the $200 \mathrm{mg} /$ day per person as the U.S. average caffeine intake from coffee.

## Tea

Trade information indicates that the U.S. population' caffeine intake from tea averages 24.3 $\mathrm{mg} /$ day. This figure is based on the following assessment:
According to the Tea Association of the USA all tea is imported, with essentially no U.S. tea export.

- In 2006, 2007, and 2008, tea imports were 116,750 , 101,281, and 101,620 MT of black and green teas, respectively. Thus, mean import volume during the past 3 years was 106,550 MT of tea.
- For all the 310 million American consumers (40) this quantity of tea provided 55 billion 8 -fl. oz. cup servings, equivalent to 177.4 cups/year per person, or $0.486 \mathrm{cup} /$ day per person.
- An average cup of tea contains 50 mg of caffeine; therefore, caffeine intake for the U.S. population is $24.3 \mathrm{mg} /$ day per person.

For entire U.S. adult population the NPD survey projected $23.2 \mathrm{mg} /$ day per person of caffeine intake from tea, which is nearly identical to the 24.3 mg intake, calculated from the trade data.

According to the Tea Association of USA annual report (36) on any given day about onehalf of the American population drinks tea. Therefore daily caffeine intake of regular tea drinkers is about $58 \mathrm{~m} /$ day, equal to about 1 cup of tea daily.
About $82 \%$ of all tea consumed in America is black tea, $17 \%$ is green tea, and a small portion of the remaining amount is Oolong and white tea. Approximately $85 \%$ of tea consumed in America is iced.

## Carbonated Soft Drinks (CSDs)

The 2008 Beverage Marketing Corporation report estimates $40 \mathrm{mg} /$ day of caffeine consumption per person from caffeine-containing CSDs as follows:

- In 2008, 9,361 million gal of caffeine-containing CSDs were sold in the United States, equivalent to 990,851 million 12 fl . oz. servings.
- The U.S. population older than 2 of 283 million consumed 353 servings/yr of caffeinecontaining CSD, equivalent to about $1-12 \mathrm{fl}$. oz. servings of caffeine-containing CSD each day.
- Regular cola drinks on average contain 40 mg of caffeine per 12 fl . oz. serving.

The $40 \mathrm{mg} /$ day daily caffeine intake is higher than the $25.7 \mathrm{mg} /$ day projected in the NPD survey for the U.S. population over 2 years of age. However, this difference has only miniscule consequences for total daily caffeine intake.
Caffeine-containing soft drinks represent about one-third (by volume) of the total U.S. liquid refreshment markets. The caffeine-containing CSD segment is dominated by three major brands: Coca Cola, PepsiCo, and Dr Pepper, which have 47.0\%, 39.6\%, and 13.4\% market shares, respectively. The CSD market has been struggling for several years. In 2008, the market decline accelerated by $3.1 \%$ in volume over the previous year.

## Energy Drinks

According to the Beverage Marketing Corporation report (27) approximately 354 million gallons of energy drinks were sold in the United States in 2008 and in 2009, representing only $1.2 \%$ (by volume) of the total CSD market. Between 2001 and 2006, market growth of these products exceeded $50 \%$ annually, but growth declined to $9 \%$ in 2008 and to $0.2 \%$ in 2009 (Figure 5).

Figure 5

Even with this small market share, this product category requires attention because some of the products contain massive doses of caffeine (over $200 \mathrm{mg} /$ serving), plus other stimulants, and because most are sold in larger single-serving units than are cola drinks ( 16 vs .12 fl . oz.). As shown in Figure 6, of the more than 150 products marketed, 7 major brands dominate the market with a $72 \%$ market share (by sales volume).

## Figure 6

Source: Compiled by the author from the Annual Report, 2008, of the Beverage Marketing Corporation, New York.
Major brands are sold in the regular retail channels, with the remaining 28\% brands marketed through direct sales organizations, exercise clubs, and the Internet. Amazon is one of the leading on-line sellers of a broad variety of caffeinated energy drinks. Energy drinks usually contain substantially more caffeine per serving than do conventional cola drinks. Of the leading brands, Red Bull contains 80 mg of caffeine per serving; Monster Energy, Rockstar, and Java Monster, 160 mg ; and NOS, 260 mg (Most caffeinated CSD beverages contain 40 mg caffeine per serving). Table 16 (pp. 30-33) lists the caffeine content of energy drinks.

The Beverage Marketing Corporation report indicates that in 2008 the mean per capita daily caffeine intake from energy drinks of the population older than 10 was 7.2 mg :

- In 2008, 366 million gallons (1,385.3 million liters) of energy drinks were sold in the United States, equivalent to 2,891 million 16 fl . oz. or 480 ml ) servings
- The U.S. population older than 10 ( 264 million) consumed $5.25 \mathrm{~L} / \mathrm{yr}$, equivalent to $14.4 \mathrm{ml} /$ day per person-or a 0.0316 fl . oz serving per day.
- Energy drinks on average contain 50 mg of caffeine per 100 ml of beverage, equal to 7.2 mg of caffeine content in the $14.4 \mathrm{ml} /$ day energy drink per-capita consumption.

However, energy drink consumption is limited to a small segment of the population but only very limited reliable information is available of the number and age distribution of regular energy drink consumers. Energy drinks are typically attractive to young people. Approximately 65\% percent of its drinkers are between the ages of 13 and 35 years old, with males being approximately $65 \%$ of the market (41). A 2008 statewide survey conducted by the Pennsylvania Medical Society's Institute for Good Medicine found that: 20 percent of respondents' ages $21-30$ had used energy drinks in high school or college to stay awake longer to study or write a paper (41). A survey by the NDP Group taken annually for a twoweek period for 9 years ending February 2010 is showing that $0.9 \%$ of the $14-21$ year old individuals are regular energy drinkers (Table 32). However, the leader of the NDP study warned that may be there is under reporting for young person because the diary was filled out by primary meal preparer for each individual and for teens one can assume they would be purchasing for themselves and possibly not informing parents all the time.

## Table 32 <br> Percent of Individuals that Consume Energy Drinks in a Two Week Period

| Individuals | Number of <br> Individuals <br> Participated | Number of <br> Individuals <br> Consuming Energy <br> Drinks | Individual <br> Penetration <br> in 2-week period <br> Percent |
| :--- | :--- | :--- | :--- |
| Total Individuals | 44,634 | 220 | 0.5 |
| 2-13 Year Old | 7,979 | 9 | 0.1 |
| 14-21 Year Old | 3,824 | 36 | 0.9 |
| Female 16-45 year old | 9,244 | 67 | 0.7 |

Source: The NDP Group, data for 9 years ending February 2010, Personal Communication
Assuming that $2 \%$ of the population older than 10 are regular consumers of energy drinks, they consume about 1.55-16 fluid oz. servings per day. Most 16 fl . oz energy drink serving contains between 150 to 300 mg of caffeine, therefore we estimate that caffeine intake of some regular energy drink consumer may be as high as $465 \mathrm{mg} / \mathrm{day}$.

In November 2009 The Food and Drug Administration notified manufacturers of caffeinated alcoholic beverages that they would have 30 days to prove "clear evidence of safety," or this product line would have to be taken off the market. At the time of preparation of this report it is unknown how many caffeinated alcoholic beverage products are still sold. However, the leading brands of this category Miller/Coors' Sparks and Anhaeuser Busch's Tilt that previously contained caffeine and guarana removed all caffeinated ingredients from their product.

## Caffeine

Imports of food-grade caffeine decreased in 2008 to 5,538 MT from the high of 7,000 MT in 2007. The chemical is added mainly to cola beverages, energy drinks, drugs and dietary supplements. Therefore, the contribution of imported caffeine to dietary intake is included in the consumption data for those products. The decline in the U.S. caffeine imports in recent years is connected to decreasing sales volumes of cola beverages.

## Cocoa

U.S. imports of cocoa and cocoa-containing ingredients increased in recent years. Cocoa is imported in several forms and grades (e.g., powder, paste, defatted, with added sweetener, in blocks of chocolate). Therefore, it is impossible to calculate the overall caffeine content of cocoa imports. However, as discussed above, cocoa-containing foods and beverages have only insignificant contribution to the total daily caffeine intake of the population.

## 3. Conclusions

The caffeine intake of the U.S. population by gender and age groups is estimated in Tables 29 and 30 and illustrated in Figure 7. Consumption figures for the overall population have been assembled from trade statistics and market information. In general the total daily caffeine intake figures are in agreement with the NHANES survey estimates shown above in Figure 1. Caffeine intake estimates for subgroups are based on the NPD daily food diary survey. The subgroups were selected according to the FDA guidelines.
More than $97 \%$ of the caffeine intake of teenagers and adults and $94.9 \%$ intake of the 2-13 year old children group come from beverage sources. An only very small amount of dietary caffeine intake is supplied by solid food. The daily caffeine intake of the adult population older than 22 was 300 mg in 2008; more than two-thirds of that amount originated from coffee drinking. The younger age groups consumed much less caffeine because their main beverage source was cola or tea, and those beverages contain much less caffeine than coffee. Women of childbearing age drank less coffee than other adult groups; consequently, their daily intake of caffeine was much less than the overall population's intake. Any change in the future caffeine intake of the U.S. population is dependent on coffee drinking habits, because all other caffeine sources make only minor contributions to overall caffeine consumption.

## Table 33

## Estimated Per Capita Daily Caffeine Intake by Gender and Age Derived from Import Statistics and Trade Association Reports

| Age Group | People <br> Age 2 + | Children <br> $\mathbf{2 - 1 3}$ | Males <br> $\mathbf{1 4 - 2 1}$ | Females <br> $\mathbf{1 4 - 2 1}$ | Adults <br> $\mathbf{2 2 +}$ | Females <br> $\mathbf{1 6 - 4 5}$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Caffeine Intake, mg/day | 240.7 | 43.5 | 110.5 | 103.4 | 300.7 | 208.2 |
| From Beverages, mg/day | 238.4 | 41.3 | 107.4 | 101.2 | 298.4 | 206.2 |
| Coffee | 153.7 | 2.5 | 25.3 | 33.7 | $206.5 \backslash^{1}$ | 123.9 |
| Tea | 24.3 | 7.9 | 24.5 | 16.2 | $28.6^{12}$ | 24.1 |
| Carbonated Beverages | 40.0 | 17.0 | 45.3 | 36.3 | 40.5 | 42.0 |
| Other Beverages | 20.4 | 13.9 | 12.3 | 15.0 | $22.8^{3}$ | 16.2 |
| From Food, mg/day | 2.3 | 2.2 | 3.1 | 2.2 | 2.3 | 2.0 |

${ }^{1 /}$ According to NCA survey (33) caffeine intake from coffee consumption of over 18 year old regular coffee drinkers is $374.7 \mathrm{mg} / \mathrm{day}$.
${ }^{2 /}$ According to the Tea Association of USA (36) daily caffeine intake from tea by regular tea drinkers is about $58 \mathrm{mg} /$ day. 3/Assuming that $2 \%$ of the adult population are regular energy drinkers their caffeine intake is between $233 \mathrm{and} 465 \mathrm{mg} /$ day. ## Appendix A

## NPD Group Daily Food Consumption Survey: "National Eating Trends" Data Collection: Method and Results

The NPD Group recruits households from a national mail panel to participate in its National Eating Trends survey. Candidates receive a sample diary, instructions, and a daily diary to complete and return. Only panelists returning acceptable diaries are asked to participate further in the study. Mailings are staggered throughout the year, with a different group beginning each Monday. Approximately 3,000 households are sent diaries, with about 2,500 households returning 10 or more diaries. From this group, 2,000 households are selected for the annual sample. Reporting is on an annual basis-March 1 through February 28-with 500 households in each quarterly subsample. Panelists receive a gift for participating.

Sample households are balanced with the total U.S. Census each quarter, using the Current Population Survey (CPS) for March from the previous year. Balancing factors include Family vs. Non-Family. Families are balanced in regard to household income, household size, age and employment status of the female homemaker (or male homemaker if the female is not present), race, and Census Region. Non-families are balanced on age, gender, household income, and Census Region.
Each participating panelist is sent 14 daily diaries to fill out, with information recorded for each household member. Diaries are mailed back as each is completed.

The survey captures all foods eaten in-home, carried from home, and eaten away-from-home in separate sections. Meal occasions are identified as main meals or snacks. Information collected includes detailed food descriptions, including brand names, preparation methods, and appliances used.

Households selected for the final 2,000 household sample must pass quality control checks on the completeness of reporting. Households must return at least 10 of 14 diaries to be considered for the sample. For each household, the number of main meals "reported" is tabulated. Reported meals include those with food recorded or meals recorded as "skipped" using a checkbox on the diary. Poor reporters are eliminated.

Tables A1-A6 and Figures A1-A6 show the results of the NPD surveys for various age and gender groups. The subgroups were selected according to the FDA guidelines; and adjustments by the author compiled from technical publications, the Internet, trade associations, and industry sources are provided for caffeine content figures.

The tables provide the following information:

- Identity of the food and beverage source
- Average daily volume of food or beverage consumed in grams
- Caffeine content in milligram per 100 g of product used by the NPD Group for the consumption estimate
- $\quad$ NPD group estimates for daily caffeine intake in milligrams
- Adjusted caffeine content per 100 g of product based on the revised data
- Adjusted estimates of daily caffeine intake in milligrams.

Please note that we believe that the data presented in the report's Conclusion section represent more reliable consumption figures that do the tables in Appendix A.

Table A1
Caffeine Intakes from Food and Beverage: Mean Amounts per Capita Consumption in One Day by Individuals 2 Years Old and Over

| Food or Beverage Source* | Consumption |  | NPD Group Caffeine Intake mg/day | Adjusted |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
